Graph Theory – 2

Planar graphs - Inequality 1

By  
Prof. S.R.S Iyengar  
Department of Computer Science

Given a graph being planar, we have observed that  $V - E + R$  is always equal to 2,  
(Refer Slide Time: 00:12)

so this is something like a regularity, that the physics of it is sort of showing us that something is very regular here, no matter what kind of a graph you can take in the world there are infinitely many of course, if it is planar you observe that  $V - E + R$  will always be equal to 2.

Now let us look at this inequality,  $3R$  is less than or equal to  $2E$ , I say this is true always, is it true? Let's verify, look at this graph here with over you count, you will observe that there are 12 vertices, 14 edges, and 4 regions,  $V - E + R$  is indeed true here,  $12 - 14 + 4 = 2$ ,  
(Refer Slide Time: 01:03)

$$3r \leq 2e$$

$$V = 12$$

$$E = 14$$

$$R = 4$$

$$12 - 14 + 4 = 2$$

but then do you think  $3R$  is being less than or equal to  $2E$  here, what is this? I say this holds good in any planar graph,  $R$  here is 4, 4 times 3 is 12, and 2 times 14 is 28, and hence 12 is definitely less than or equal to 28 and this holds good for any planar graph,  
(Refer Slide Time: 01:22)

$$3r \leq 2e$$

$$V = 12$$

$$E = 14$$

$$R = 4$$

$$12 - 14 + 4 = 2$$

$$3(4) = 12 \quad 2(14) = 28$$

$$\therefore 12 < 28$$

why is this happening? This is a very important inequality, it will help you solve something that we have been talking from some time, okay, I'll reveal the climax soon but in its own right we'll try to solve this problem, so how is  $3R$  less than or equal to  $2E$  here? Look at this, look at the first region, (Refer Slide Time: 01:45)

IIT  
Ropar

$$3r \leq 2e$$

$$12 - 14 + 4 = 2$$

$$3(4) = 12 \quad 2(14) = 28$$

$$\therefore 12 < 28$$

$$V = 12$$

$$E = 14$$

$$R = 4$$

first region has at least 4 edges, second region has at least 3 edges, let me write that down  $R_1$  has 4 edges,  $R_2$  has 3 edges,  $R_3$  has 7 edges, and  $R_4$  let me count 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, has 12 edges, (Refer Slide Time: 02:04)

$$R_1 \rightarrow 4 \quad R_2 \rightarrow 3 \quad R_3 \rightarrow 7 \quad R_4 \rightarrow 12$$

now do you see each region has at least 3 edges, so the total number of regions if it is  $R$ , you will have at least  $3R$  number of edges that come in this regions, so let me say  $3R$  is at least is less than or equal to the cumulative sum of all the edges that you write down corresponding to the regions, so  $3R$  is less than or equal to the sum total here, what is that  $4 + 3 + 7 + 12$ , correct, you add all of them, what is that 14, 15, 16, 26 correct, the total is 26,  
(Refer Slide Time: 02:45)

If total number of regions =  $x$

These are atleast  $3x$  edges.

$$3x \leq (4 + 3 + 7 + 12)$$

$$3x \leq 26$$

so that is my cumulative sum, so  $3R$  is less than equal to 26 which is my sum of all the edges that appear as part of a region, but then there's something when I observe here every edge comes at most across 2 regions, look at this edge here 2, 5,  
 (Refer Slide Time: 03:06)

IIT  
Ropar

If total number of regions =  $x$   
 There are atleast  $3x$  edges.

$3x \leq (4 + 3 + 7 + 12)$   
 $3x \leq 26$

NPTEL

it is an edge that is counted both in region 1 and region 2, so every edge is counted at most twice, why do I say at most twice? Look at this edge 1, 2 or 11,12,  
 (Refer Slide Time: 03:17)

If total number of regions =  $r$

There are at least  $3r$  edges.

$$3r \leq (4 + 3 + 7 + 12)$$

$$3r \leq 26$$

it is counted only once in region 4 so it's counted at least once and at most twice, so my cumulative sum this 26 is definitely less than or equal to 2 times the edges, an edge at most is counted twice and not more, so this should be less than or equal to  $2E$  and hence  $3R$  is less than or equal to  $2E$ ,  
(Refer Slide Time: 03:40)

If total number of regions =  $r$

There are at least  $3r$  edges.

$$3r \leq (4 + 3 + 7 + 12)$$

$$3r \leq (26) \leq 2e$$

$$3r \leq 2e$$

a very important result let us keep it aside and meanwhile I am going to challenge you people with this question, can you tell me how can you prove this  $3R$  less than or equal to  $2e$  using induction, just the way we solved that  $V - E + R = 2$  using induction, can you show that  $3R$  is less than or equal to  $2E$  using induction.

Let us look at another inequality now, I also show you that  $E$  is always less than or equal to  $3V - 6$ , it sounds like crazy you see I'm just going on giving you some inequalities you probably are wondering why are we even doing this, yes even I would wonder the same if I were in your place, but you will see some magic happen very soon,  $E$  is less than or equal to  $3V - 6$  always is that true? Let us try this in our graph here,

(Refer Slide Time: 04:36)

$E$  is 14, so  $14 E$  is less than or equal to 3 times 12, that is  $36 - 6$  which is 30, of course yes  $14 E$  is less than or equal to 30 which means this inequality seems to be true at least in this case,

(Refer Slide Time: 04:52)

$$e \leq 3v - 6$$

$$14 \leq 3(12) - 6$$

$$14 \leq 30$$

why is it true? Let's observe, look at this  $2 = V - E + R$ , that's right, correct,  
(Refer Slide Time: 05:00)

$$e \leq 3v - 6$$

$$14 \leq 3(12) - 6$$

$$14 \leq 30$$

$$2 = v - e + r$$

but then  $R$  is less than or equal to  $2E/3$ , why? Because we saw that  $3R$  is less than or equal to  $2E$ , we prove it just now, so  $2 = V - E + R$  which is less than or equal to  $V - E + 2E/3$ , because  $R$  is less than or equal to  $2E/3$ , and then the next step I get  $2$  is less than or equal to  $V - E/3$ ,  
 (Refer Slide Time: 05:25)

**IIT  
Ropar**

$$e \leq 3v - 6$$

$$14 \leq 3(12) - 6$$

$$14 \leq 30$$

$$2 = v - e + \textcircled{8} \leq 2e/3$$

$$2 \leq v - e + 2e/3$$

$$2 \leq v - e/3$$

**IITEL**

a little bit of juggling here and there gives me  $6$  is less than or equal to  $3V - E$  multiplying  $3$  throughout and then putting  $E$  on the left side and putting  $6$  on the right side you get the answer which is  $E$  is less than or equal to  $3V - 6$ .

(Refer Slide Time: 05:41)

$$e \leq 3v - 6$$

$$14 \leq 3(12) - 6$$

$$14 \leq 30$$

$$2 = v - e + 8 \leq 2e/3$$

$$2 \leq v - e + 2e/3$$

$$2 \leq v - e/3$$

$$6 \leq 3v - e \Rightarrow e \leq 3v - 6$$
