Fourier Analysis: Complex Exponential Fourier Series, Trigonometric Fourier Series – Even and Odd Signals

Hello welcome to another module in this massive open online course all right. So, we are looking at the properties of signals and systems and in particular we are trying to interrupt we are focusing on introducing the Fourier analysis or the Fourier transform right as a very viable and a convenient method to understand and analyze the properties various properties of signals and systems all right.

(Refer Slide Time: 00:39)

So, let us continue our discussion on this Fourier analysis and of course, we are looking initially at the Fourier analysis for continuous time signals and systems, subsequently we will look at the Fourier analysis for discrete time system signals and systems. So, we are looking at the Fourier analysis and this is for continuous, continuous time signals.

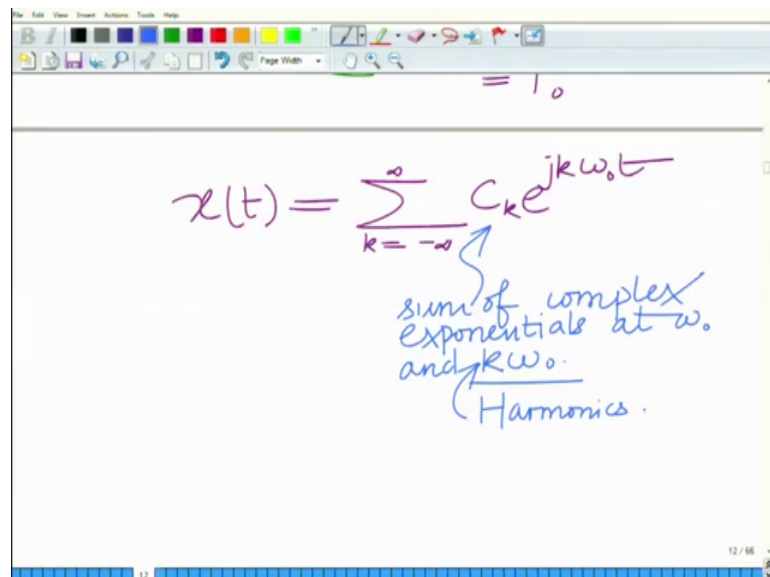

In particular we are looking at the Fourier analysis for a, we are looking at the Fourier series.

(Refer Slide Time: 01:25)

We are looking at we have started with what is known as the Fourier series and the Fourier series representation is as follows. For any periodic signal remember the Fourier series exists is defined for a periodic signal, continuous periodic signal with a fundamental period that is equal to T_0 , with the fundamental period equals T_0 .

(Refer Slide Time: 02:11)

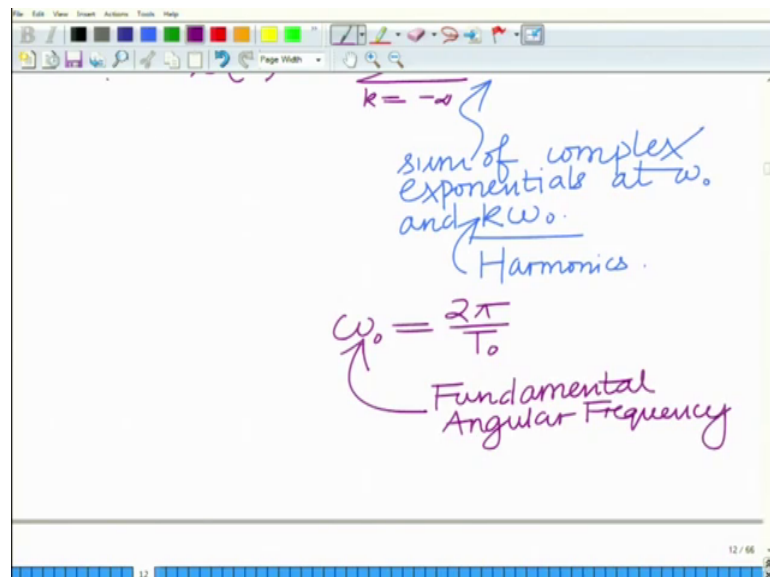

And it can be shown that such a periodic signal with fundamental period T_0 can be expressed as the sum of complex exponentials, correct that is what you see and this is important to understand. It can be expressed as sum of an infinite number of complex

exponentials at the fundamental frequency ω_0 and then its various harmonics, that is frequencies $k \omega_0$. Where, k is an integer multiple of ω_0 , $k \omega_0$, where $k \omega_0$ is an integer multiple of ω_0 there is k is an integer ok.

So, this sum can be expressed as summation k equal to minus infinity to infinity $C_k e^{j k \omega_0 t}$ correct, sum of complex exponentials and remember these are the harmonics that is when you have $k \omega_0$ these are known as the harmonics and remember ω_0 is the fundamental angular frequency.

(Refer Slide Time: 03:31)

ω_0 equals 2π by T_0 , this is important to remember this is the fundamental; this is the fundamental angular frequency and the coefficient C_k in the Fourier series.

(Refer Slide Time: 03:58)

$$C_k = \frac{1}{T_0} \int_{T_0} x(t) e^{-jkw.t} dt$$

Fundamental Angular Frequency

k^{th} Fourier series Coefficient

The coefficient C_k are given as one over T_0 integral over any period T_0 of $x(t) e^{-jkw.t} dt$, this is the coefficient k^{th} Fourier series coefficient.

This is your k^{th} , this is your k^{th} Fourier series coefficient and remember we have derived this yesterday the formula to derive the k^{th} Fourier series coefficient of $x(t)$ we have looked at that and how to derive that formula correct or how to derive this expression that we have looked at yesterday. Today let us continue our discussion on this Fourier series coefficient, now let us assume that $x(t)$.

Now, let us look at some of the properties of this Fourier series representation.

(Refer Slide Time: 04:57)

Handwritten slide content:

$$C_k = \frac{1}{T_0} \int_{T_0} x(t) e^{-jk\omega_0 t} dt$$

k^{th} Fourier series Coefficient

If $x(t) = \text{Real}$, Real Signal

$$C_k^* = \left(\frac{1}{T_0} \int_{T_0} x(t) e^{jk\omega_0 t} dt \right)^*$$

Now, if $x(t)$ is real; that means, imaginary part of $x(t)$ is zero. If $x(t)$ is a real signal then we have, remember we have this already C_k equals integral over T_0 of $x(t) e^{-jk\omega_0 t} dt$. Now, if I take C_k conjugate here, that will be the conjugate on the right hand side and now if I bring the conjugate operation inside.

(Refer Slide Time: 05:53)

Handwritten slide content:

$$= \frac{1}{T_0} \int_{T_0} x^*(t) e^{jk\omega_0 t} dt$$

since $x(t)$ is real
 $x^*(t) = x(t)$

$$\Rightarrow C_k^* = \frac{1}{T_0} \int_{T_0} x(t) e^{jk\omega_0 t} dt$$

C_k

Now; obviously, t is real that is the time.

So, we simply have one over T naught integral over T naught, x conjugate T e raised to minus j k omega naught T conjugate of that is e raised to J k omega naught t d t. Now, since x is real x t is real x t conjugate equals x t, x conjugate equal to x t which implies c k conjugate equals 1 over T naught, c k conjugate equals 1 over T naught integral over any period T naught x t, since x t conjugate equals x t e raised to J k omega naught T d t but.

Now, if you look at this, this is nothing, but c of minus k the Fourier series coefficient at the integer minus k that is one over T naught integral or t naught x t e raised to plus j k omega naught T d t that is nothing, but the Fourier series coefficients c minus k. So, this implies for a real signal x t, C conjugate of k equals c minus of k.

(Refer Slide Time: 07:31)

Handwritten derivation on a whiteboard:

since $x(t)$ is real
 $x(t) = x^*(t)$

$$\Rightarrow c_k^* = \frac{1}{T_0} \int_{T_0} x(t) e^{jk\omega_0 t} dt$$

c_{-k}

For a real signal $x(t)$,
 we have,

$c_k^* = c_{-k}$

conjugate symmetry

That is the Fourier series coefficients exhibit conjugate symmetry and this is an important property for real signal x t we have c conjugate k equals c minus of k, that is the exhibit conjugate symmetry, that is the exhibit conjugate symmetry for a real signal x t ok.

So, that is an interesting and that is also an important property that is, which means that.

(Refer Slide Time: 08:21)

For a real signal $x(t)$, we have,

$$C_k^* = C_{-k}$$

Conjugate symmetry

$$|C_k| = |C_k^*| = |C_{-k}|$$
$$\Rightarrow |C_k| = |C_{-k}|$$

Magnitude of Fourier coefficients exhibits Even symmetry.

Now, if you look at this magnitude of c_k that is if we look at the magnitude spectrum magnitude of c_k correct because magnitude of C_k equals magnitude of c_k conjugate which is equal to since c_k conjugate equals c_{-k} . So, that is will be magnitude of c_{-k} which implies that the magnitude spectrum will have even symmetry. So, implies magnitude of C_k that is the magnitude of Fourier is, magnitude of Fourier coefficients exhibits and similarly if you look at the phase spectrum the angle of c_k equals minus angle of c_k conjugate and then c_k conjugate equals C_{-k} .

(Refer Slide Time: 09:16)

Coefficients Even symmetry.

$$\angle C_k = -\angle C_k^*$$
$$= -\angle C_{-k}$$
$$\Rightarrow \angle C_k = -\angle C_{-k}$$

Phase spectrum exhibits odd symmetry.

So, this is minus of angle of c minus k which implies the phase angle of ck equals minus of angle of c . So, the phase spectrum that is if you look at, what that is, that is what we mean by that is the phase of the spectral coefficients, remember we said we can think of the Fourier series as the spectral domain representation all right. So, if you look at the phase spectrum of the phase of these different spectral coefficients that exhibits an odd symmetry. So, the phase spectrum, the phase spectrum exhibits an odd symmetry. So, that is an interesting property.

(Refer Slide Time: 10:27)

Phase spectrum exhibits odd symmetry

TRIGONOMETRIC FOURIER
SERIES :

$$x(t) = \frac{a_0}{2} + \sum_{k=1}^{\infty} a_k \cos(k\omega_0 t) + b_k \sin(k\omega_0 t)$$

Complex

Let us now move to a different representation although related this is known as the trigonometric Fourier series, the trigonometric and this is simply as follows that is if I have the signal $x(t)$ which is a periodic signal that can be represented as a constant over 2π plus summation k equals to 1 to infinity $a_k \cos(k\omega_0 t) + b_k \sin(k\omega_0 t)$ this is the trigonometry these are; obviously, these are trigonometric functions that is the cosine and sin these are not complex exponentials.

Therefore this is known as the trigonometric Fourier series representation, it is convenient we are going to look at its properties and these coefficients once again these can be complex. The a_k 's, these coefficients can be complex for a general signal $x(t)$ these can be complex and what is a_k ?

(Refer Slide Time: 11:58)

SERIES :

$$x(t) = \frac{a_0}{2} + \sum_{k=1}^{\infty} a_k \cos(k\omega_0 t) + b_k \sin(k\omega_0 t)$$

$a_k = \frac{2}{T_0} \int_{-T_0/2}^{T_0/2} x(t) \cos(k\omega_0 t) dt$

$b_k = \frac{2}{T_0} \int_{-T_0/2}^{T_0/2} x(t) \sin(k\omega_0 t) dt$

And now you can also derive this similar to how we derived the expression for c_k , you will realize that once again the cosines and the sines are orthogonal correct, that is if you multiply cosine $k\omega_0 t$ by any sine $l\omega_0 t$ or any cosine $l\omega_0 t$ and integrate over one period that is t through the product vanishes all right.

So, you can see that these basis functions the cosines and sines is a chosen for a particular reason because these are orthogonal. Correct, similar to the complex exponentials at different that is a different harmonics that is $k\omega_0 t$ and $l\omega_0 t$ orthogonal these are also orthogonal and you can based on that property you can readily derive what are the expressions for these coefficients of the trigonometric Fourier series ok.

(Refer Slide Time: 13:41)

$$b_k = \frac{2}{T_0} \int_{-T_0/2}^{T_0/2} x(t) \sin(k\omega_0 t) dt$$

FOURIER SERIES:

$$x(t) = \sum_{k=-\infty}^{\infty} c_k e^{jk\omega_0 t} dt$$

$$= c_0 + \sum_{k=1}^{\infty} c_k e^{jk\omega_0 t} + c_{-k} e^{-jk\omega_0 t}$$

$$= c_0 + \sum_{k=1}^{\infty} (c_k + c_{-k}) \cos k\omega_0 t$$

So, that is a k equals 2 over t naught summation x , integral x t you know cosine k omega naught T . Notice that there is a factor of 2 here and this you will see in the derivation, one should not forget this and b k equals summation twice over t naught integral over t naught x t sin k omega naught t d t and now if you compare with the Fourier series. Now, let us look at these 2 things side by side now compared with the Fourier series that is the general Fourier series with the complex exponential.

If you compare that you can see we have the Fourier series is summation k equals minus infinity to infinity $c_k e$ raised to j k omega naught t d t which I can write as summation for lets first isolate the term corresponding to k equal to 0. So, that is 0 plus summation k equal to no for each k that is non 0 you have 2 terms, one is $c_k e$ raised to j k omega naught t plus the other is $c_{-k} e$ raised to minus J k omega naught and this second further simplified as follows c naught.

I can further simplify this as follows, c naught plus summation k equal to 1 to infinity that is you have well $c_k e$ raised to j k omega naught t plus $c_{-k} e$ raised to minus J omega naught t . So, that will give you well that will give you c_k plus c_{-k} because you can write e raise to j k omega naught t as cosine k omega naught t plus J times C k minus c_{-k} sin k omega naught t ok .

(Refer Slide Time: 15:22)

The image shows a handwritten derivation on a digital whiteboard. The top part shows the function $x(t)$ as a sum of complex exponentials: $x(t) = \sum_{k=-\infty}^{\infty} C_k e^{jk\omega_0 t}$. This is then rearranged to separate the DC component C_0 and the positive and negative frequency components: $= C_0 + \sum_{k=1}^{\infty} C_k e^{jk\omega_0 t} + C_{-k} e^{-jk\omega_0 t}$. The next step uses Euler's formula to express these as cosine and sine terms: $= C_0 + \sum_{k=1}^{\infty} (C_k + C_{-k}) \cos(k\omega_0 t) + j(C_k - C_{-k}) \sin(k\omega_0 t)$. Below the equations, it says "By comparison of coeffs between Fourier Series & Trigonometric Fourier Series". The whiteboard interface includes a toolbar at the top and a status bar at the bottom showing "17 / 66".

$$x(t) = \sum_{k=-\infty}^{\infty} C_k e^{jk\omega_0 t}$$

$$= C_0 + \sum_{k=1}^{\infty} C_k e^{jk\omega_0 t} + C_{-k} e^{-jk\omega_0 t}$$

$$= C_0 + \sum_{k=1}^{\infty} (C_k + C_{-k}) \cos(k\omega_0 t) + j(C_k - C_{-k}) \sin(k\omega_0 t)$$

By comparison of coeffs between Fourier Series & Trigonometric Fourier Series

And therefore, what you can see now by simple comparison of coefficients you can see by comparing, by comparison of coefficients between the Fourier series and the trigonometric Fourier series. Comparison of the coefficients between the Fourier series and the trigonometric Fourier series you can see that.

(Refer Slide Time: 16:22)

The image shows a handwritten derivation on a digital whiteboard. It starts with the equation from the previous slide: $= \frac{C_0}{\frac{a_0}{2}} + \sum_{k=1}^{\infty} \frac{(C_k + C_{-k})}{a_k} \cos(k\omega_0 t) + j \frac{(C_k - C_{-k})}{a_k} \sin(k\omega_0 t)$. Below this, it says "By comparison of coeffs between Fourier Series & Trigonometric Fourier Series". The bottom part of the slide shows the resulting relationships: $C_0 = \frac{a_0}{2}$ and $a_k = C_k + C_{-k}$. The whiteboard interface includes a toolbar at the top and a status bar at the bottom showing "17 / 66".

$$= \frac{C_0}{\frac{a_0}{2}} + \sum_{k=1}^{\infty} \frac{(C_k + C_{-k})}{a_k} \cos(k\omega_0 t) + j \frac{(C_k - C_{-k})}{a_k} \sin(k\omega_0 t)$$

By comparison of coeffs between Fourier Series & Trigonometric Fourier Series

$$C_0 = \frac{a_0}{2}$$

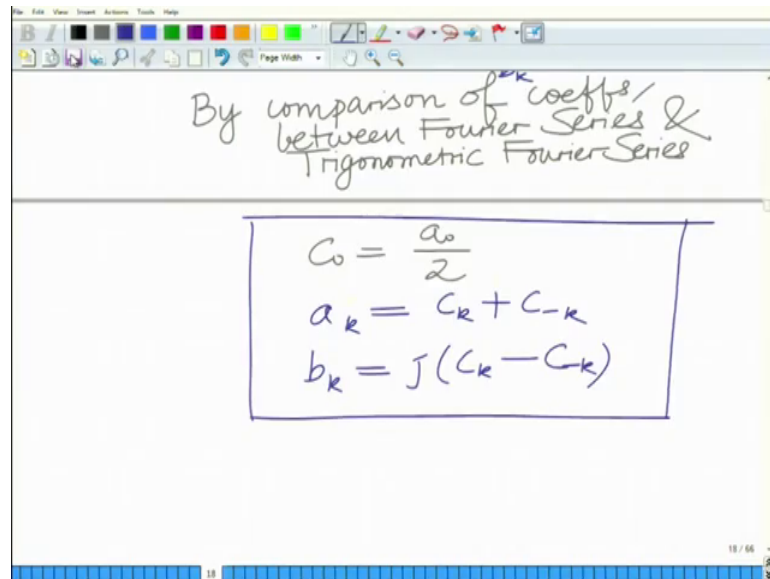

$$a_k = C_k + C_{-k}$$

You know first of all you can see that the dc coefficient equals corresponding to 0 frequency equals $a_0/2$ plus and you can see a_k the coefficient of cosine k

ω naught T, that is that is equal to c_k plus c minus k look at this, this is your a_k and this is your b_k that is coefficient of $\sin k$ and this is your a naught by 2.

So, c naught equals a naught by 2 a_k equals c_k plus c minus k and b_k equals J times C_k minus c minus k .

(Refer Slide Time: 17:57)

By comparison of coeffs between Fourier Series & Trigonometric Fourier Series

$$c_0 = \frac{a_0}{2}$$
$$a_k = c_k + c_{-k}$$
$$b_k = j(c_k - c_{-k})$$

That is the relation between the Fourier series coefficients of the relations between the coefficients, there is a relationship between the coefficients of the Fourier series and the trigonometric Fourier series all right. Both of them are equivalent from one through the coefficients of 1 you can get the other ok.

And now; obviously, you can simplify this other way also that is finding the coefficients of the Fourier series from the trigonometric Fourier series.

(Refer Slide Time: 17:34)

The image shows a whiteboard with handwritten mathematical equations. At the top, two equations are boxed together: $a_k = c_k + c_{-k}$ and $b_k = j(c_k - c_{-k})$. Below these, the equation $jb_k = -c_k + c_{-k}$ is written. Then, an arrow points to a large box containing two equations: $\frac{a_k - jb_k}{2} = c_k$ and $\frac{a_k + jb_k}{2} = c_{-k}$. The whiteboard interface includes a toolbar at the top and a status bar at the bottom right showing '18 / 66'.

So, this gives the trigonometric Fourier series in terms of the Fourier series, now Fourier series in terms of the trigonometric Fourier series you can see that J times b_k equals J into J that is minus 1, minus of c_k plus c_{-k} which implies that a_k plus J times b_k or a_k minus J times b_k divided by 2 equal to c_k and a_k plus J times b_k divided by 2 equals c_{-k} .

So, these are the coefficients relationship of the Fourier series coefficients, in terms of the coefficients of that trigonometric series.

(Refer Slide Time: 18:27)

The image shows a whiteboard with handwritten text and equations. The text reads: "IF $x(t)$ is real, Then, a_k, b_k are Real." This is underlined. Below this, the equation $a_k = c_k + c_{-k}$ is written, followed by $= c_k + c_k$ with a red 'x' over the second c_k . A large box contains the equation $a_k = 2 \operatorname{Re}\{c_k\}$. A red arrow points from the text " $x(t)$ is Real" to the box. The whiteboard interface includes a toolbar at the top and a status bar at the bottom right showing '19 / 66'.

Now, once again if $x(t)$ and $b(t)$ are real or if $x(t)$ is real then the coefficients of the trigonometric series a_k and b_k are real. If $x(t)$ is real then a_k and b_k the different a_k s and b_k s is that is the coefficients in the trigonometric Fourier series these are real quantities all right and also we have remember, you can look at it this way a_k look at the relationship between a_k and c_k a_k equals remember c_k plus c_{-k} , but if $x(t)$ is real then we have C_k equals c_{-k} conjugate which means we have c_k plus c_{-k} c_k conjugate.

So, this is c_k conjugate. So, this is c_k plus c_k conjugate equals twice the real part of so c_k plus c_k conjugate is twice a real part of c_k , but remember this only if $x(t)$ is real only when $x(t)$ equal $x(t)$ equals.

(Refer Slide Time: 19:58)

The image shows a handwritten derivation on a whiteboard. At the top, it shows the relationship between a_k and c_k :

$$a_k = c_k + c_{-k}$$

$$= c_k + c_k^*$$
 This is boxed as:

$$a_k = 2 \operatorname{Re}\{c_k\}$$
 A red arrow points from the text " $x(t)$ is Real." to the boxed equation. Below this, the derivation for b_k is shown:

$$b_k = j(c_k - c_{-k})$$

$$= j(c_k - c_k^*)$$

$$= j \cdot 2j \operatorname{Im}(c_k)$$
 This is boxed as:

$$b_k = -2 \operatorname{Im}(c_k)$$
 The whiteboard also shows a software interface at the top with various icons and a page number "20 / 66" at the bottom right.

Now, in addition now remember b_k equals j times c_k minus c_{-k} equals j times c_k minus, remember c_{-k} C_k conjugate. So, c_k minus c_k conjugate equals j into j times the imaginary part off or twice the imaginary or twice j times the imaginary part of C_k which is minus twice the imaginary part of c_k . So, b_k equals minus twice the imaginary part of C_k for real arguments again for a real signal $x(t)$, for a real signal $x(t)$.

(Refer Slide Time: 20:37)

$b_k = -2\text{Im}(c_k)$

For real signal $x(t)$

EVEN & ODD SIGNALS:

If $x(t) = \text{even}$
Then $b_k = 0$
Coefficients of $\sin k\omega t$

Now, what about even and odd signals let us look at some other interesting property that is for even and odd signals.

Now if or even and odd signals, if $x(t)$ is even remember then in the trigonometric Fourier series it is easy to infer that you know b_k is equal to 0 remember these b_k s are coefficients of the sin functions and remember sin of $k\omega t$ this is an odd function, correct.

(Refer Slide Time: 21:50)

EVEN & ODD SIGNALS:

If $x(t) = \text{even}$
Then $b_k = 0$
Coefficients of $\sin k\omega t$

$\Rightarrow x(t) = \frac{a_0}{2} + \sum_{k=1}^{\infty} a_k \cos(k\omega t)$

Even signal

odd function

only cos terms remain

Sin of minus of x is minus of sin of x. So, sin function is an odd function. So, if x t is even naturally you would expect the coefficients of the sinusoid the pure sin, that is sin k omega naught t that is the b ks to be 0.

Again this can be formally proved also it is not very difficult to prove this and you can show that therefore, which implies the trigonometric Fourier series is given as x t equals a naught by 2 plus summation k equal to 1 to infinity a k cosine k times omega naught t that is because the b ks are 0. So, the sin terms vanish this is for a even signal only the cosine terms remain, you can see only the cosine terms remain.

(Refer Slide Time: 23:07)

Handwritten mathematical derivation on a whiteboard:

$$\Rightarrow x(t) = \frac{a_0}{2} + \sum_{k=1}^{\infty} a_k \cos(k\omega_0 t)$$

Annotations:

- even signal (pointing to the equation)
- only cos terms remain (pointing to the sum)
- Even Function (written in green)

IF $x(t) = \text{odd}$,
 $a_k = 0$
 coefficients of $\cos(k\omega_0 t)$
 Even Function

However if x t is odd then we have the a ks are 0 remember, a ks these are coefficients of cosine k omega naught t and cosine k omega naught t remember this is a even function and as is the dc component. So, when x t is odd the coefficients of the even components in the Fourier in the trigonometric Fourier series, that is the cosine right the cosine functions these vanish.

(Refer Slide Time: 23:58)

$a_k = 0$
Coefficients of $\cos(k\omega_0 t)$
Even Function
 $x(t) = \sum_{k=1}^{\infty} b_k \sin(k\omega_0 t)$
 $\omega_0 = \frac{2\pi}{T_0}$
Fundamental Angular Frequency

So, therefore, naturally the a_k s are all the a_k s are 0 and therefore, the Fourier series or the trigonometric Fourier series can be expressed as $x(t)$ equal.

So, it is a very convenient way to basically express the trigonometric Fourier series it has very convenient way to express, the expansion of the series of $x(t)$ is simply summation k equal to 1 to infinity $b_k \sin k \omega_0 t$ and remember ω_0 as always is 2π by T_0 this is the fundamental, this is the fundamental angular frequency. So, that completes the discussion on the trigonometric Fourier series.

So, what we are going to do. So, what we have seen in this module is basically I think we can stop here. So, what we have seen in this module is we have seen the we have started with the discussion of the Fourier series, started looking at the trigonometric Fourier series related these 2 expansions. These are equivalent one from the trigonometric Fourier series co presentation one can get the Fourier series from the Fourier series, one can get the trigonometric Fourier series and we have seen the various properties of the coefficients. So, will stop here and continue in the subsequent modules.

Thank you very much.
