Fourier Analysis Examples - Complex Exponential Fourier Series of Periodic Square Wave

Hello welcome to another module in this massive of online course. So, we are looking at the Fourier analysis of both discrete time and as well as continuous time; Fourier analysis for periodic as well as aperiodic signals alright. And we looked at the theory corresponding to that and now let us start at this module, we are going to start looking at various problems to better understand the implications and the applications of the Fourier analysis for continuous time signal that we have seen so far.

(Refer Slide Time: 00:45)

The image shows a presentation slide with a white background and a blue border. At the top, there is a toolbar with various icons. The main content is written in green and blue ink. The title 'EXAMPLE PROBLEMS' is underlined in green. Below it, 'FOURIER ANALYSIS:' is also underlined in green. The first problem is labeled '# 1: Consider' in blue, followed by the equation $x(t) = \cos\left(2t + \frac{\pi}{4}\right)$ in blue. The slide number '42' is visible in the bottom right corner.

So, let us start by our looking at example problems for Fourier analysis that is the Fourier analysis of continuous time signals and systems alright; and let us start with problem number 1 which is basically consider the signal $x(t)$ equals cosine $2t$ plus π by 4 .

(Refer Slide Time: 01:50)

1: Consider

$$x(t) = \cos\left(2t + \frac{\pi}{4}\right)$$

Complex Exponential Fourier Series (CEFS)

$$\omega_0 = 2$$
$$\text{Period} = \frac{2\pi}{\omega_0} = T_0$$

$$= \frac{2\pi}{2} = \pi$$

We want to obtain its complex exponential Fourier series or what we can abbreviate as the CEFS we want to obtain CEFS for this given signal that is $x(t) = \cos(2t + \pi/4)$. Now what we can observe here is that from this you can observe that the period is π . So, this is the cosine $2t$ alright. So, $\omega_0 = 2$ which means the period of the fundamental period of this equals $2\pi/\omega_0$, that is equal to $2\pi/2$ which is equal to π and $\omega_0 = 2$.

(Refer Slide Time: 03:01)

$$\omega_0 = 2$$
$$\text{Period} = \frac{2\pi}{\omega_0} = T_0$$

$$= \frac{2\pi}{2} = \pi$$
$$\omega_0 = 2$$
$$x(t) = \sum_{k=-\infty}^{\infty} C_k e^{jk\omega_0 t}$$

So, I can express this as $x(t)$ this is CEFS representation k equals minus infinity to infinity $C_k e^{jk\omega_0 t}$ C_k denotes the coefficient the complex coefficient corresponding to the k th harmonic correct that is the frequency component, which is k times ω_0 where ω_0 is the fundamental frequency T_0 is the fundamental period of this periodic signal.

(Refer Slide Time: 03:52)

The image shows a whiteboard with handwritten mathematical equations. The top equation is the complex exponential Fourier series representation:
$$x(t) = \sum_{k=-\infty}^{\infty} C_k e^{jk\omega_0 t}$$
 Below this, the cosine function is expressed as the sum of two complex exponentials:
$$x(t) = \cos\left(2t + \frac{\pi}{4}\right) = e^{j\left(2t + \frac{\pi}{4}\right)} + e^{-j\left(2t + \frac{\pi}{4}\right)}$$
 The final step shows the coefficients:
$$= \frac{1}{2} e^{j\frac{\pi}{4}} e^{j2t} + \frac{1}{2} e^{-j\frac{\pi}{4}} e^{-j2t}$$

And now rather than evaluate this directly evaluate the coefficients directly, we can see that I can evaluate this as $x(t)$ equals I can directly evaluate this as $x(t)$ equals cosine $2t$ plus $\pi/4$ which is $e^{j\theta} + e^{-j\theta}$ divided by 2. So, this is $e^{j2t + j\pi/4} + e^{-j2t - j\pi/4}$ divided by 2.

Which I can write as half $e^{j\pi/4} e^{j2t}$ plus half $e^{-j\pi/4} e^{-j2t}$.

(Refer Slide Time: 05:06)

$$= \frac{1}{2} e^{j\frac{\pi}{4}} + \frac{1}{2} e^{-j\frac{\pi}{4}}$$
$$= C_1 e^{j\omega t} + C_{-1} e^{-j\omega t}$$
$$C_1 = \frac{1}{2} e^{j\frac{\pi}{4}}$$
$$= \frac{1}{2} \left(\cos \frac{\pi}{4} + j \sin \frac{\pi}{4} \right)$$

Which is equal to $C_1 e^{j\omega t}$ plus you can see this $C_{-1} e^{-j\omega t}$ where this coefficients C_1 you can see this is basically your C_1 and this is basically your C_2 . So, C_1 is basically this coefficients. So, C_1 equals well half $e^{j\pi/4}$ equals half well $e^{j\theta}$ is $\cos \theta + j \sin \theta$. So, $e^{j\pi/4}$ is half $\cos \pi/4 + j \sin \pi/4$.

(Refer Slide Time: 06:02)

$$= \frac{1}{2} \left(\frac{1}{\sqrt{2}} + j \frac{1}{\sqrt{2}} \right)$$
$$C_1 = \frac{1+j}{2\sqrt{2}}$$
$$C_{-1} = \frac{1}{2} e^{-j\frac{\pi}{4}}$$

Which is half 1 over $\sqrt{2}$ plus 1 over $\sqrt{2}$ which is 1 plus of course, 1 plus j over $2\sqrt{2}$ ok. So, this is c_1 equals 1 plus j over $2\sqrt{2}$. So, the coefficients C_1 in the CEFS is one plus j over twice square root of 2 .

Similarly, C_{-1} that is the coefficient of e raised to minus $j\omega t$ or minus $j\pi t$ in this case is c_{-1} equals well half e raised to minus $j\pi$ by 4 .

(Refer Slide Time: 06:53)

$$\begin{aligned}
 C_{-1} &= \frac{1}{2} e^{-j\pi/4} \\
 &= \frac{1}{2} \left(\cos \frac{\pi}{4} - j \sin \frac{\pi}{4} \right) \\
 &= \frac{1}{2} \left(\frac{1}{\sqrt{2}} - \frac{j}{\sqrt{2}} \right) \\
 &= \frac{1-j}{2\sqrt{2}}
 \end{aligned}$$

Which is half cosine π by 4 minus j sin π by 4 which is basically half one over $\sqrt{2}$ minus j over $\sqrt{2}$ equals 1 minus j over $2\sqrt{2}$ ok. And you can clearly see from this is that, from this you can clearly see that all C_k that is because since this is expressed simply as a combination of e raised to $j\omega t$ and e raised to minus $j\omega t$ all the term C_k for k not equal to 1 , that is C_0 as well as C_2 C_{-2} C_3 C_{-3} minus etcetera. So, on as it is C_k for any k not equal to either 1 or -1 is basically 0 ok. So, all the coefficients. So, C_k the rest of the C_k .

(Refer Slide Time: 08:01)

The image shows a handwritten derivation on a whiteboard. At the top, the expression $= \frac{1}{2} \left(\frac{1}{\sqrt{2}} - \frac{j}{\sqrt{2}} \right)$ is written. Below it, the coefficient C_{-1} is boxed and defined as $C_{-1} = \frac{1-j}{2\sqrt{2}}$. Underneath the box, it is noted that $C_k = 0 \forall |k| \neq 1$. The whiteboard interface includes a toolbar at the top and a page number '45 / 122' at the bottom right.

Equal to 0 for all mod k not equal to 1, that is either k equal to plus 1 or minus 1. That is the complex exponential Fourier series and these are the coefficients. So, this is coefficient C minus 1 in the complex exponential Fourier series and this is the coefficients C 1 in the complex exponential Fourier series now let us look at a periodic sequence or periodic square wave.

(Refer Slide Time: 08:40)

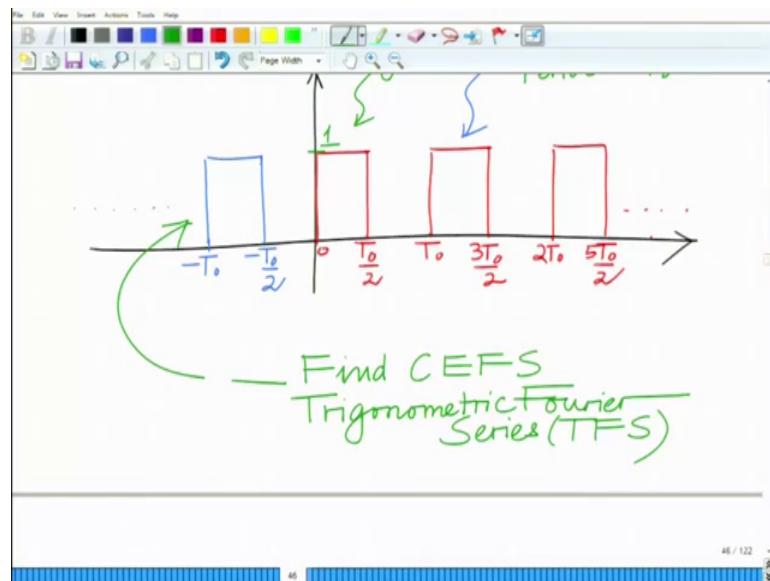

So, let us look at this is example number 2 which we want to look at a periodic square wave and periodic square wave can be represented as follows. So, you have a square

wave which is periodic. So, this is of width T naught by 2 and this has a period of T naught. So, this has a period of T naught. So, this is minus t naught over 2.

So, this is your periodic square wave correct this is your periodic square wave and the time period here equals the time period here equals T naught and let us say the height is equal to height of each square pulse or the amplitude of each square pulse is 1 and what we want to do is for this periodic square wave.

(Refer Slide Time: 10:37)

We want to find the complex exponential Fourier series and also the trigonometric; remember this is an alternative Fourier series representation, which is known as the trigonometric Fourier series we want to denote this by TFS. So, want to find the complex exponential Fourier series and as well as the trigonometric Fourier series representation Fourier series representation for this periodic square wave, which are square pulses of height 1 width T naught over 2 and fundamental period is T naught.

Alright and this can be done as follows now first observe.

(Refer Slide Time: 11:27)

Handwritten notes on a whiteboard:

$$\text{Fundamental Period} = T_0$$
$$\Rightarrow \omega_0 = \frac{2\pi}{T_0}$$
$$\Rightarrow x(t) = \sum_{k=-\infty}^{\infty} c_k e^{jk\omega_0 t}$$

CEFS

47 / 122

So, first observe that the fundamental period, the fundamental period equals T_0 which implies $\omega_0 = \frac{2\pi}{T_0}$ and this implies that $x(t) = \sum_{k=-\infty}^{\infty} c_k e^{jk\omega_0 t}$. So, I can write the CEFS $x(t) = \sum_{k=-\infty}^{\infty} c_k e^{jk\omega_0 t}$. So, this is your CEFS representation the complex exponential Fourier series because this is periodic with T_0 $\omega_0 = \frac{2\pi}{T_0}$ this is the CEFS representation.

(Refer Slide Time: 12:30)

Handwritten notes on a whiteboard:

$$\Rightarrow x(t) = \sum_{k=-\infty}^{\infty} c_k e^{jk\omega_0 t}$$

CEFS

$$c_k = \frac{1}{T_0} \int_0^{T_0} x(t) e^{-jk\omega_0 t} dt$$
$$= \frac{1}{T_0} \int_0^{T_0/2} e^{-jk\omega_0 t} dt$$

47 / 122

And now we can find the coefficients C_k can be found as remember is $1/T$ times integral you can find it as 0 to T for any period T of duration T integrals period of duration T in fact, $x(t)$ is a pulse of height one in the period 0 to T over 2 in that pulse of height one. So, this is $x(t)$ will be $1, 0$ to T over 2 $e^{-jk\omega_0 t}$.

(Refer Slide Time: 13:22)

$$\begin{aligned}
 &= \frac{1}{T_0} \int_0^{T_0/2} e^{-jk\omega_0 t} dt \\
 &= \frac{1}{T_0} \left[\frac{e^{-jk\omega_0 t}}{-jk\omega_0} \right]_0^{T_0/2} \\
 &= \frac{1}{T_0} \frac{e^{-jk\omega_0 T_0/2} - 1}{-jk\omega_0}
 \end{aligned}$$

Which you can see is basically $1/T$ times $e^{-jk\omega_0 t}$ evaluated between the limits, 0 to T over 2 which is 1 over T times $e^{-jk\omega_0 T/2} - 1$ divided by $-jk\omega_0$.

(Refer Slide Time: 14:08)

The image shows a handwritten derivation of the Fourier series coefficient C_k . At the top, it states $\omega_0 = \frac{2\pi}{T_0} \Rightarrow \omega_0 T_0 = 2\pi$. Below this, the coefficient is given as $C_k = \frac{1 - e^{-jk\pi}}{jk2\pi}$. A note indicates that $e^{-jk\pi} = (-1)^k$. The bottom part of the slide shows the simplified expression: $C_k = \frac{1 - (-1)^k}{jk2\pi}$.

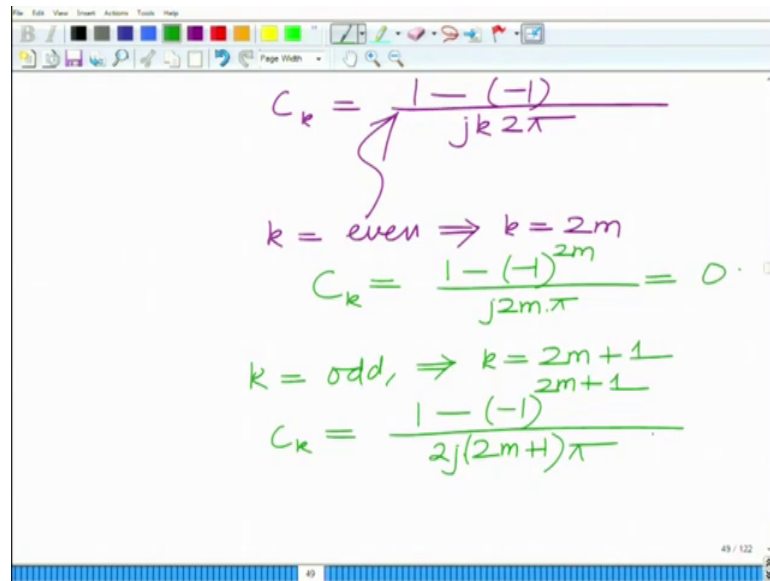

And now realize that we have $\omega_0 T_0 = 2\pi$ which implies $\omega_0 T_0 = 2\pi$ and therefore, this form this expression for C_k can be simplified as look at this in the numerator we have $\omega_0 T_0 = 2\pi$. So, $\omega_0 T_0 = 2\pi$ will be π and the denominator we have $T_0 \omega_0 = 2\pi$. So, this will be $1 - e^{-jk\pi}$ divided by $jk\pi$.

So, this is the expression form the coefficients C_k which is a complex exponential Fourier series coefficient all right this is $C_k = \frac{1 - e^{-jk\pi}}{jk\pi}$. And we have used the principle that $\omega_0 T_0 = 2\pi$; $\omega_0 T_0 / 2$ is simply π .

And now you can observe that $e^{-jk\pi}$ is nothing, but $(-1)^k$. So, this is $e^{-jk\pi}$ is basically $(-1)^k$ which is nothing, but $(-1)^k$. So, this if you see this is $e^{-jk\pi}$ this is $(-1)^k$, which is basically $(-1)^k$.

So, $C_k = \frac{1 - (-1)^k}{jk\pi}$ and now you can observe that if k is even.

(Refer Slide Time: 16:19)

The image shows a handwritten derivation on a whiteboard. At the top, the equation $C_k = \frac{1 - (-1)^k}{jk2\pi}$ is written. A purple arrow points from the exponent k in the denominator to the text $k = \text{even} \Rightarrow k = 2m$. Below this, the equation $C_k = \frac{1 - (-1)^{2m}}{j2m\pi} = 0$ is written. Then, the text $k = \text{odd}, \Rightarrow k = 2m + 1$ is written. Finally, the equation $C_k = \frac{1 - (-1)^{2m+1}}{2j(2m+1)\pi}$ is written. The whiteboard interface includes a toolbar at the top and a page number '49 / 122' at the bottom right.

$$C_k = \frac{1 - (-1)^k}{jk2\pi}$$

$k = \text{even} \Rightarrow k = 2m$

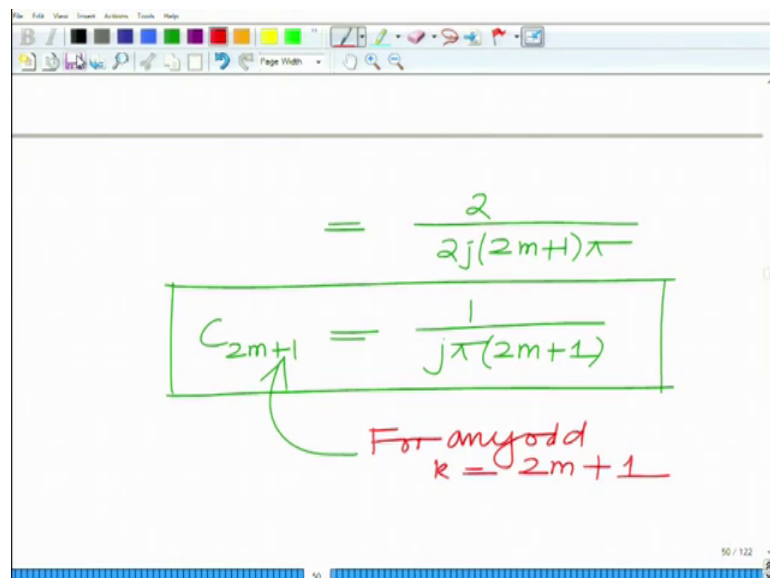

$$C_k = \frac{1 - (-1)^{2m}}{j2m\pi} = 0$$

$k = \text{odd}, \Rightarrow k = 2m + 1$

$$C_k = \frac{1 - (-1)^{2m+1}}{2j(2m+1)\pi}$$

Implies if k is equal to $2m$ this is equal to c of k equals 1 minus -1 to the power of $2m$ over j into $2m$. Now you can see 1 minus 1 to the power of $2m$ this is simply 0 . So, C_k is 0 if k is even and if k is odd implies k equals $2m + 1$, then C_k equals 1 minus -1 raised to $2m + 1$ divided by j $2m + 1$ times π or in fact, j twice $2m + 1$ times π equals 2 .

(Refer Slide Time: 17:32)

The image shows a handwritten derivation on a whiteboard. At the top, the equation $= \frac{2}{2j(2m+1)\pi}$ is written. Below this, the equation $C_{2m+1} = \frac{1}{j\pi(2m+1)}$ is written and enclosed in a green rectangular box. A green arrow points from the text $\text{For any odd } k = 2m + 1$ to the boxed equation. The whiteboard interface includes a toolbar at the top and a page number '50 / 122' at the bottom right.

$$= \frac{2}{2j(2m+1)\pi}$$
$$C_{2m+1} = \frac{1}{j\pi(2m+1)}$$

For any odd $k = 2m + 1$

Over $2j$ into $2m + 1\pi$, which is nothing, but in fact, this is C of $2m + 1k$ equals $2m + 1$ see one over j times π into $2m + 1$.

For any therefore, any odd k for any odd k equal to $2m + 1$ for any odd k equals $2m + 1$ ok. So, for even k it is 0.

(Refer Slide Time: 18:15)

$$C_{2m} = 0$$

$$C_0 = \frac{1}{T_0} \int_0^{T_0} x(t) dt$$

$$= \frac{1}{T_0} \int_0^{T_0/2} 1 dt$$

$$C_0 = \frac{1}{T_0} \cdot \frac{T_0}{2} = \frac{1}{2}$$

For odd k it is one over $j\pi(2m + 1)$ and the dc coefficient remember C naught C naught c naught that corresponding to k equal to 0 that is termed as dc coefficient, which is simply 1 over T naught times the integral of the function over the interval of duration t naught. So, this is 1 of the over T naught that is the average time average of the signal 0 to T naught $x(t) dt$ which is basically your 1 over T naught again this is non-zero only in 0 to T naught over 2 times $1 dt$, which is basically 1 over t naught into T naught over 2 . So, this t naught is equal to half and therefore, finally, what we have is basically we have $x(t)$ equals half plus 1 over $j\pi$ summation m equal to minus infinity to infinity 1 over.

(Refer Slide Time: 19:11)

$$C_0 = \frac{1}{T_0} \cdot \frac{1}{2} = \frac{1}{2}$$
$$x(t) = \frac{1}{2} + \frac{1}{j\pi} \sum_{m=-\infty}^{\infty} \left(\frac{1}{2m+1} \right) e^{j(2m+1)\omega_0 t}$$
$$x(t) = \frac{1}{2} + \frac{1}{j\pi} \sum_{m=-\infty}^{\infty} \frac{1}{(2m+1)} e^{j(2m+1)\omega_0 t}$$

CEFS.

So, this exists only for even k that is of the form $2m + 1$. So, 1 over $2m + 1$ I have taken the $j\pi$ outside since it is common e raised to $j(2m + 1)\omega_0 t$ or I can just write it just write it once more a little clearly. So, $x(t)$ equals half plus 1 over $j\pi$ summation m equal to minus infinity to infinity, 1 over $2m + 1$ e raised to $j(2m + 1)\omega_0 t$. So, this is your complex exponential, this is basically the complex exponential Fourier series representation.

This is the complex exponential Fourier series representation of the signal all right. So, basically what we have done in this module is we have started looking at the problems for the Fourier analysis of continuous signals, and systems all right. In particular, we have looked at an example which basically finds the Fourier complex exponential Fourier series of a simple signal followed by the complex exponential Fourier series of periodic square wave of a square wave. And we are also going to the subsequent module we also find the trigonometric Fourier series representation of this all right. So, we stop here.

Thank you very much.
