Lecture - 54
Fourier Analysis of Discrete Time Signals and Systems – Introduction

Hello. Welcome to another module in this massive open online course. In this module, we are going to look at, start looking at the Fourier analysis for discrete time signals and systems.

(Refer Slide Time: 00:40)

So, So, far we have looked at the Fourier analysis for continuous time periodic as well as a periodic signal. A periodic signals starting with this module, we are going to start looking at discrete time periodic as well as periodic signals, alright. So, we are going to start looking at the Fourier analysis, the Fourier analysis for discrete time ok, for discrete time signals and discrete time signals and systems for that matter; so the discrete Fourier series.

Now, we are going to start with, what is known as the discrete Fourier series? Now, the discrete Fourier series, this is defined for a discrete time periodic signal. This is design for discrete time periodic signals, similar to the complex exponential Fourier series and the trigonometric Fourier series that are defined for continuous time periodic signals. The discrete Fourier series is defined for a discrete time periodic signal ok.

(Refer Slide Time: 02:35)

The slide shows a whiteboard with a toolbar at the top. The title "Discrete time periodic Signals." is written in red. Below it, the equation $x(n+N_0) = x(n)$ is written in blue, with "For all n" written below it. A blue arrow points from the text "Discrete Time signal. = Periodic with Period = N_0 ." written in purple below the equation to the N_0 term in the equation.

And so, we consider a discrete time periodic signal with period N_0 such that $x(n + N_0) = x(n)$ for all n , then we say the discrete time periodic sequence, discrete time periodic signal equals is periodic with period equals N_0 all right.

So, when there exists at N_0 , for a discrete time signal $x(n)$ such that $x(n + N_0) = x(n)$ for all n all right. We say all right, the discrete time signal is periodic and its period is N_0 ok.

(Refer Slide Time: 03:48)

The slide shows a whiteboard with a toolbar at the top. The title "Discrete Time Periodic Signal" is written in purple, followed by "= Periodic with Period = N_0 ." also in purple. Below this, an example is given: "ex: $x(n) = e^{j\Omega_0 n}$ " where $\Omega_0 = \frac{2\pi}{N_0}$, and the signal is also written as $= e^{j\frac{2\pi}{N_0}n}$. At the bottom, the periodicity is demonstrated: $x(n+kN_0) = e^{j\frac{2\pi}{N_0}(n+kN_0)}$.

All right and for example, we have seen that the exponential signal, we have x of n equals e raised to the complex exponential signal e raised to j omega n , where omega equals is of the form 2π over N . This is a periodic signal with period N that is you have x of n equals e raised to j n not 2π by N of n and if you looked at x of n plus N in for that matrix of n plus kN , where k is any integer.

(Refer Slide Time: 04:44)

$$\begin{aligned}
 x(n+kN_0) &= e^{j2\pi \frac{n+kN_0}{N_0}} \\
 &= e^{j2\pi \frac{n}{N_0}} \cdot e^{j2\pi k} \\
 &= e^{j2\pi \frac{n}{N_0}} \cdot \frac{1}{1} \\
 &= e^{j2\pi \frac{n}{N_0}} \\
 &= e^{j\omega_0 n} \\
 \boxed{x(n+kN_0) = x(n)}
 \end{aligned}$$

This is e raised to j 2π over N n plus kN , which is equal to e raised to j 2π over N n into e raised to j 2π k . This is equal to 1 for all k .

So, this is simply e raised to j 2π over N times n , which is nothing, but e raised to j omega n this is e raised to j omega n which is basically x of n . So, we have x of n . In fact, we have x of n plus kN equals x of n . So, we have x of n plus kN equals x of n for all n .

(Refer Slide Time: 05:50)

The image shows a whiteboard with handwritten mathematical derivations. At the top, it says "= periodic with Period = N₀". Below that, an example is given: "ex: x(n) = e^{jω₀n}". A red arrow points from the exponent to the definition "ω₀ = 2π / N₀". This is followed by "= e^{j(2π/N₀)n}" with "Period = N₀" and "Periodic DT signal" written in red. A horizontal line separates this from the next part, which shows "x(n + kN₀) = e^{j(2π/N₀)(n + kN₀)}". This is then simplified to "= e^{j(2π/N₀)n} · e^{j2πk}". The second exponential term is underlined and labeled "1", indicating it equals 1.

So, which means this is a periodic signal, periodic discrete time signal and the period equals N naught ok. So, e raise to j omega naught n, where omega naught is 2 pi N naught and not being an integer is a periodic signal is a discrete time periodic signal and the period is n ok.

(Refer Slide Time: 06:25)

The image shows a whiteboard with the title "DFS REPRESENTATION:" underlined. Below the title, it says "x(n) → Fundamental Period = N₀". Below that, the equation "x(n) = ∑_{k=0}^{N₀-1} c_k e^{jkω₀n}" is written in green.

Now, the Discrete Fourier Series representation is given as follows; we can, the Discrete Fourier Series representation is given as follows. So, consider a signal x n and the fundamental period that is a smallest period. Fundamental period equals N naught then

this can be expressed as $x(n)$ can be expressed as the sum of the complex exponential signals k equal to 0 to $N_0 - 1$ $C_k e^{jk\omega_0 n}$ and these are, these C_k 's are basically the coefficients of the Discrete Fourier Series.

(Refer Slide Time: 07:36)

$$x(n) = \sum_{k=0}^{N_0-1} C_k e^{jk\omega_0 n}$$

Coefficients of Discrete Fourier Series.

Frequencies
 $= k\omega_0, k=0, 1, \dots, N_0-1$
 $= 0, \frac{2\pi}{N_0}, \frac{4\pi}{N_0}, \dots, \frac{2\pi(N_0-1)}{N_0}$

These are the coefficients of the Discrete Fourier Series or DFS. So, you can see that, this can be expressed as a sum of a finite number of complexes, unlike the complex Fourier. The complex Fourier series, which is the sum of an infinite number of complex exponentials corresponding to the fundamental frequency and its harmonics, this can be, that is a periodic discrete time signal can be expressed as a sum of a finite number of complex exponentials with, with frequencies 0 to π over N_0 2π over N_0 4π over N_0 times $N_0 - 1$.

So, the frequencies are frequencies of the complex exponentials are k times ω_0 k equals 0 1 up to $N_0 - 1$. So, the frequencies are basically 0 2π over N_0 4π over N_0 so on. 2π over N_0 into $N_0 - 1$. So, these are the discrete set of frequencies all right. The set of discrete is the set of frequencies ok .

(Refer Slide Time: 09:20)

$$0, \frac{2\pi}{N}, \frac{4\pi}{N}, \dots, \frac{2\pi(N-1)}{N}$$

Finite Set of Frequencies

$$C_l =$$

So, $0, \frac{2\pi}{N}, \frac{4\pi}{N}, \dots, \frac{2\pi(N-1)}{N}$. These are the finite set of frequencies. So, the complex; so basically, so the periodic sequence, the periodic discrete time signal with fundamental period N can be expressed as the sum of a finite set of complex exponential signals all right. Corresponding to the frequencies that are given as multiples of $\frac{2\pi}{N}$ all right, multiples integer, multiples integers ranging from 0 to $N-1$ of the fundamental frequency, $\frac{2\pi}{N}$ ok.

And now, how to find these coefficients of the DFS, the discrete Fourier series, that is C_l , what is the coefficient the l coefficient of the DFS.

(Refer Slide Time: 10:36)

Finite Set of Frequencies

$$C_l = ?$$

Consider

$$\sum_{n=0}^{N_0-1} x(n) e^{j l \Omega_0 n}$$

$$= \sum_{n=0}^{N_0-1} \sum_{k=0}^{N_0-1} C_k e^{j k \Omega_0 n} e^{-j l \Omega_0 n}$$

And you can see that is given as follows. Now, consider summation n equals 0 to N naught minus 1 x n e raised to j minus l omega naught n, this is equal to substituting. Now, the expression for the DFS equal to 0 to N naught minus 1 C k e raised to j k omega naught n into e raised to minus j l omega naught n into e raised to minus j l omega naught n.

(Refer Slide Time: 11:33)

$$= \sum_{k=0}^{N_0-1} C_k \sum_{n=0}^{N_0-1} e^{j \Omega_0 (k-l)n}$$

= 0 For $k \neq l$

$$= \frac{1 - e^{-j \Omega_0 (k-l) N_0}}{1 - e^{-j \Omega_0 (k-l)}}$$

$= N_0$

And now, interchanging the summation; so I have summation k equal to 0 to N naught minus 1 can take C k out. Since, that depends only on k summation n equal to 0 e raise to

$j k e$ raised to $j \omega$ naught k minus l into n ok. Now, you can see for k not equal to l . In fact, this sum is equal to equal to 0 for k naught equal to. In fact, for k naught equal to l . This is 1 minus e raise to minus $j \omega$ naught k minus l times, N naught by 1 minus e raise to minus $j \omega$ naught e raise to minus $j \omega$ naught k minus l ok.

And e raise to minus $j \omega$ naught N naught that is 2π . So, this quantity. Here is 1 minus e raise to minus $j k$ minus l in k minus l and this quantity is 0. The numerator is 0, because 1 raised to minus $j k$ minus l 2π is 1. So, this is missing, when k is not equal to l , this is 0. So, the only case that is remaining is, when k equal to l , when k equal to l k equals l , this is e raised to $j \omega$ naught 0, which is 1; so summation of 1 n equal to 0 to N naught minus 1 that is N naught ok.

So, what we are left with is basically a naught, if k is equal to l at 0, if p is k k is not equal to l .

(Refer Slide Time: 13:46)

$$= C_l \cdot N_0$$

$$N_0 C_l = \sum_{n=0}^{N_0-1} x(n) e^{-j l \omega n}$$

$$\Rightarrow C_l = \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-j l \omega n}$$

And therefore, only the C_k , the coefficient C_k corresponding to k equal to l survives. So, that will be C_l times N naught, which means, we have summation n equal to 0, which means we have N naught into C_l equals summation n equal to 0 to n naught minus 1 x n e raise to minus $j \omega$ naught e raised to minus $j l \omega$ naught n , which basically, implies that your C_l the l th coefficient of the discrete Fourier series is 1 over N naught, n equal to 0 to N naught minus 1 x n e raised to minus $j l \omega$ naught n ok.

So, that is basically your discrete Fourier series coefficients. So, this is and you can also verify that these summations need not be over N naught equals 0 to n minus 1 in fact.

(Refer Slide Time: 15:18)

$$\Rightarrow C_l = \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-j\omega_0 n}$$

$$= \frac{1}{N_0} \sum_{n < N_0} x(n) e^{-j\omega_0 n}$$

Summation can be over any contiguous N samples.

This can be over any N naught contiguous samples. So, you can have this from n equals N naught right. So, this can be from 0 to n minus 1 or this can be from n equals 1 to N naught or this can be from 2 to N naught plus 1. So, it, it can be or the summation can be taken over any contiguous and not samples and that I am representing it using this notation.

So, summation can be over any contiguous N N naught samples the DC coefficient and finally, you can see the DC coefficient, 1 equal to 0 C naught equals 1 over N naught summation, n equal to 0 to N naught minus 1 x n .

(Refer Slide Time: 16:26)

The image shows a whiteboard with handwritten notes. At the top, it says $N_0 \cdot T = \langle N_0 \rangle$. Below that, it says "Summation can be over any contiguous N samples." In the middle, the DC coefficient is defined as $C_0 = \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n)$. An arrow points from C_0 to the text "DC coeff". Another arrow points from the sum to the text "mean of samples over Period. N_0 ".

So, this is the DC coefficient simply, the mean of the samples over a period, over the single period N naught all right.

So, this is the mean of the samples. Sample mean of the samples over a single period N naught ok. So, this is basically the expression of; so, this is basically the expression for the inverse discrete Fourier series that is to extract the coefficients C_k 's of the coefficient C_l from the periodic discrete time signal $x(n)$ ok.

(Refer Slide Time: 17:37)

The image shows a whiteboard with handwritten notes. It repeats the formula for C_0 and its interpretation as the mean of samples over a period. Below this, it says "CONVERGENCE OF DFS:" in red. An arrow points from this text to the phrase "Guaranteed Convergence. Because finite sum."

And now, coming to converge as the discussion on convergence is going to be very brief. Now, the convergence there are typically no issues. The convergence is guaranteed, because it is a finite sum. Now, you can see basically, both the discrete Fourier series correct if you can look at this expression for the discrete Fourier series. So, this is a finite sum.

(Refer Slide Time: 18:27)

DFS REPRESENTATION:

$x(n)$ → Fundamental Period = N_0
 ← Finite Sum

$$x(n) = \sum_{k=0}^{N_0-1} C_k e^{jk\omega_0 n}$$

Coefficients of Discrete Fourier Series.
 Frequencies = $k\omega_0$, $k=0, 1, \dots, N_0-1$
 = $0, 2\pi, 4\pi, \dots, 2\pi/N_0$

For finite sum, we mean the summation over a finite number of elements and as well as the inverse discrete Fourier series to relate the coefficients C_k , this is also a finite sum right.

(Refer Slide Time: 18:43)

$$\begin{aligned} c_k &= \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-j(k-2\pi)n} \\ &= \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-jk-2\pi n} \end{aligned}$$

Finite Sum

Summation can be over any contiguous N samples.

So, this is also a finite sum. So, because both the sums are finite, the convergence is guaranteed, all right. The convergence is currently under certain, very mild conditions ok. So, the convergence is there typically, because unlike both the continuous time periodic, the continuous time periodic signal and there as well as the continuous time, a periodic signals, because in the continuous. In the case of the continuous time periodic signals, it is a summation over infinite series, there is a complex exponential Fourier series and in the case of the continuous time, a periodic signals, it is integral over an infinite duration and it is in both those scenarios. It is important to ensure that the relevant summations or the integrals converts.

However, since in this case both the summations are finite summations that is a summation over a finite number of terms, the convergence is guaranteed ok, all right. The periodicity of the Fourier series, Fourier series coefficients then you will also note that these Fourier series coefficients.

(Refer Slide Time: 19:57)

PERIODICITY OF DFT
COEFFICIENTS.

$$C_k = \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-jk\omega_0 n}$$
$$C_{k+N_0} = \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-j(k+N_0)\omega_0 n}$$

It is coefficients are periodic that is very easy to see, you can see that C_k is 1 over N naught summation n equal to 0 to N naught minus 1 $x(n)$ e raise to minus $j k \omega_0$ naught n .

Now, if you consider C of k plus N naught that is equal to 1 over N naught summation n equal to 0 to n minus 1 $x(n)$ e raise to minus $j k$ plus N naught ω_0 naught n , which is a 1 over N naught.

(Refer Slide Time: 21:13).

$$C_k = \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-jk\omega_0 n}$$
$$C_{k+N_0} = \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-j(k+N_0)\omega_0 n}$$
$$= \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-jk\omega_0 n} \cdot \frac{e^{-jN_0\omega_0 n}}{1}$$

Summation n equal to 0 to N naught minus 1 $x(n)$ $e^{j k \omega_0 n}$ times $e^{-j 2 \pi n}$ is 1. So, this is $2 \pi n$ and e raised to minus $j 2 \pi n$ is 1.

(Refer Slide Time: 21:46)

$$C_{k+N_0} = \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n) e^{-j(k-N_0)n}$$

$$= C_k$$

$C_{k+N_0} = C_k$

\swarrow
 C_k

And therefore, this again reduces to C_{k+N_0} reduces to $1/N_0$ $\sum_{n=0}^{N_0-1} x(n) e^{-j k \omega_0 n}$, which is nothing, but C_k .

So, we have $C_{k+N_0} = C_k$ sorry, this is capital N_0 . This is for any general k implies. The discrete Fourier series is periodic implies the DFS coefficients are periodic.

(Refer Slide Time: 22:37)

$$C_{k+N_0} = \frac{1}{N_0} \sum_{n=0}^{N_0-1} x(n)e^{jkn}$$
$$= C_k$$

$C_{k+N_0} = C_k$

DFS coefficients are periodic.

Spectral Coefficients of $x(n)$

So, we have a discrete time periodic signal in time and the corresponding discrete time, Fourier series corresponding the discrete Fourier series coefficients in the frequency domain are also periodic and the period incidentally is the same that is a period is N naught for both the time, as well as the spectral domain.

And. In fact, these quantities, these are known as the spectral coefficients these quantities. The C_k s C_{k+N_0} , these are known as the spectral coefficients of $x(n)$. These are known as the spectral coefficients of, these are known as the spectral coefficients of $x(n)$, all right.

So, in this mode you will started looking at the discrete Fourier series or the Fourier analysis for discrete time discrete time signals and we have started with the discrete time, discrete Fourier series for a periodic discrete time signals, alright.

So, we will stop here and continue in the subsequent modules.

Thank you very much.
