Lecture – 01
Vectors and Matrices – Linear Independence and Rank

Hello. Welcome to this module in this massive open online course. So, let us start with the mathematical preliminaries that are required to understand the framework of optimization that is which form the basis of building the framework for optimization, the various tools and techniques for optimization, ok.

(Refer Slide Time: 00:37)

So, we want to start with the mathematical preliminaries, the notation and so on that we are going to use frequently in our treatment of optimization in order to illustrate or in order to basically describe the various concepts of optimization.

Now, the first thing that we are going to use the mathematical construct that we are going to use is that of a vector, as you must all be familiar or vector \vec{x} which is denoted by a bar on the top of the quantity. So, this basically is, so let us start with the concept of vectors and a vector is denoted by the quantities like this that is of the bar on the top. So, this is basically a vector. So, vector \vec{x} is an n dimensional object which contains n components. These are the elements.

So, this is your, this is basically your n-dimensional, this is your n dimensional vector contains n elements. This is an n dimensional vector.

(Refer Slide Time: 02:28)

The image shows a whiteboard with handwritten notes. At the top, the word "VECTORS" is written in purple. Below it, a column vector is defined as $\vec{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$. An arrow points to the vector symbol \vec{x} with the label "vector". Another arrow points to the column vector with the label "column vector n x 1". A third arrow points to the vector with the label "n Dimensional Vector". Below the vector, it is noted that $x_1, x_2, \dots, x_n \in \mathbb{R}$ (Real numbers), which implies $\vec{x} \in \mathbb{R}^n$ (n Dimensional Real vectors).

$$\vec{x}^T = [x_1, x_2, \dots, x_n]$$

And now if these elements x_1, x_2, x_n these belong to the real field that is these are real numbers, then we say that this is an n dimensional real vector that is \vec{x} belongs to the set of n dimensional real vectors, all right. So, this is the this phase of n dimensional real vectors.

(Refer Slide Time: 03:16)

The image shows a whiteboard with handwritten notes. At the top, the row vector is defined as $\vec{x}^T = [x_1, x_2, \dots, x_n]$. An arrow points to the row vector with the label "Row vector 1 x n". Below it, the dot product of the row vector and the column vector is shown as $\vec{x}^T \vec{x} = [x_1, x_2, \dots, x_n] \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$.

And, so what we have is, if you consider \bar{x} now, \bar{x} is the column vector and therefore, \bar{x} transpose we will similarly be a row vector. So, it will be a 1 cross n. So, this is basically your row vector, \bar{x} transpose. So, this so, \bar{x} is a column vector or basically n cross 1, has dimension n cross 1. Now \bar{x} transpose, now, this you can see this is a row vector which is of dimension 1 cross n. That is 1 row and n columns and further, \bar{x} transpose \bar{x} , this is basically your x_1, x_2, x_n , the row vector times the product with the column vector x_1, x_2, x_n .

(Refer Slide Time: 04:29)

$$= x_1^2 + x_2^2 + \dots + x_n^2$$

$$= \|\bar{x}\|_2^2$$

l_2 norm = Default

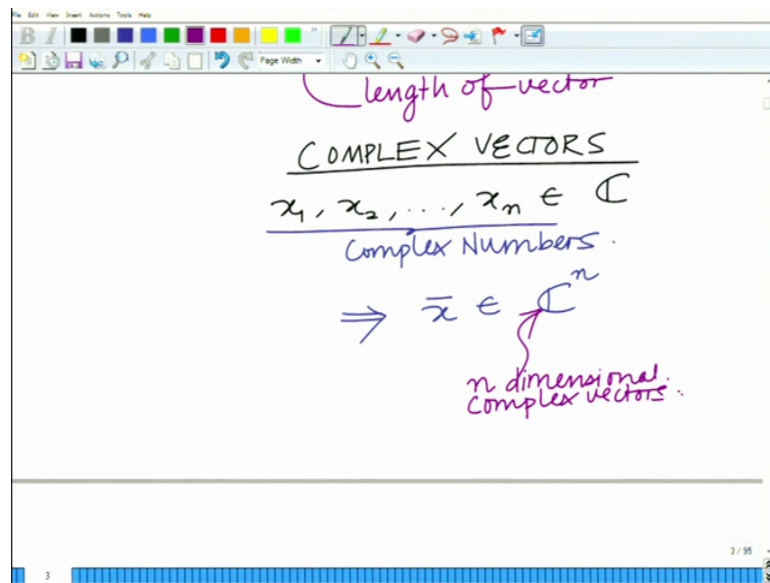

$$\|\bar{x}\| = \sqrt{x_1^2 + x_2^2 + \dots + x_n^2}$$

length of vector

And you can see, this is basically equal to you can see this is x_1 square, say these are real quantities x_2 square plus x_n square which is also denoted by the norm square and in fact, we will see this is a specification of norm, this is the l_2 norm. So, this is the square of the so, this indicates the l_2 norm of the vector, where norm of \bar{x} and this l_2 norm is the default.

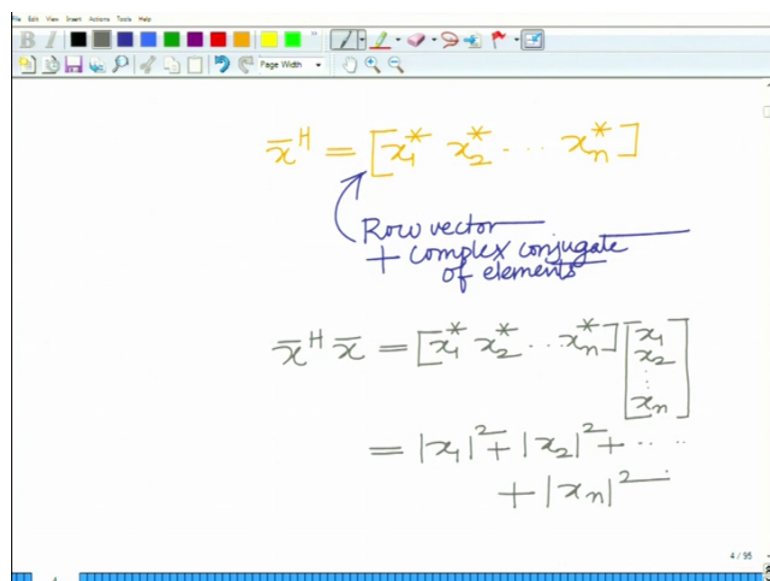

So, this is the l_2 norm which is the default norm that we will use. So, if there is a known of so, the norm is explicit or not specified explicitly, it is it will it indicates the l_2 norm, all right. And l_2 norm of a vector is basically something that you are already be very familiar with that is simply the length of the vector, length of a vector in n dimensional space ok. So, norm \bar{x} is simply something that you are very must be most of you might be very familiar with that is square root of x_1 square plus x_2 square plus x_n square which is basically the length of the vector, all right.

(Refer Slide Time: 06:10)

Now, on the other hand, now you have since real vector similarly, if x_1, x_2, x_n belong to the set of complex number. So, now, what we want to see is we want to see the notion of a complex vector. So, a complex vector if x_1, x_2, x_n are elements belong to \mathbb{C} that is these are complex numbers, then this implies that \bar{x} , the vector \bar{x} belongs to the set of n dimensional complex vector \mathbb{C}^n that is, this is n dimensional, the space of n dimensional the space of n dimensional complex vectors.

(Refer Slide Time: 07:18)

Now, \bar{x} Hermitian, this is basically equal to x_1 conjugate, x_2 conjugate, x_n conjugate that is first you take that is when you take the Hermitian of a vector or matrix in fact.

Now, here in this case you are taking the Hermitian of a vector, the column vector becomes a row vector and you also in addition take the complex conjugate of each complex element. So, that is basically your \bar{x} Hermitian, all right. So, two steps; one is you basically, perform row vector plus the complex conjugate of the elements and \bar{x} Hermitian into \bar{x} is equal to x_1 , x_2 conjugate, x_n conjugate times x_1 , x_2 , x_n and this is equal to now the magnitude; look at this is x_1 conjugate into x_1 , that is the magnitude x_1 square plus magnitude x_2 square plus so on up to magnitude x_n square which is once again, this is equal to the norm. In fact, the l_2 norm of \bar{x} square.

(Refer Slide Time: 09:09)

$$= |x_1|^2 + |x_2|^2 + \dots + |x_n|^2$$

$$= \|\bar{x}\|_2^2$$

$$\|\bar{x}\| = \sqrt{|x_1|^2 + |x_2|^2 + \dots + |x_n|^2}$$

You can also write a 2 in the subscript 2, indicate that is the l_2 norm.

And therefore, once again now you see that in this case the norm of a complex vector \bar{x} , this is square root of magnitude x_1 square plus magnitude x_2 square plus magnitude x_n square. That is where we have replaced x_i square with magnitude x_i square. In fact, this is a general definition that is magnitude x_1 , magnitude x_2 square, magnitudes plus magnitude x_n square and square root of that quantity. This definition is generalize, it works for both the real works for both the real as well as complex vectors ok.

So, this in that sense, this is a general definition,.

(Refer Slide Time: 10:07)

The image shows a whiteboard with two mathematical definitions written in red and green ink. The first definition, written in red, is $\|\vec{x}\| = \sqrt{|x_1| + |x_2| + \dots + |x_n|}$. An arrow points from this equation to the text "General Definition For real & complex vectors." written in blue. The second definition, written in green, is $\tilde{x} = \frac{\vec{x}}{\|\vec{x}\|}$. An arrow points from this equation to the text "unit - Norm vector." written in blue. The whiteboard also shows a toolbar at the top and a status bar at the bottom with the number 5.

For real number, you can simply replace the magnitude square by the square of the element. So, this general definition for real and this is general definition that is applicable both for real and complex vectors. Now, a special kind of a vector is obtained as following that is \tilde{x} equals \vec{x} bar divided by the norm of \vec{x} bar. That is you are taking the vector \vec{x} bar and dividing it by the by it is norm and that gives a unit norm vector. So, in this vector \tilde{x} is basically unit norm vector because one you can show that the norm of \tilde{x} is unity. So, this vector \tilde{x} as an interesting property; \tilde{x} is a unit norm. So, \tilde{x} is a unit norm vector and we can simply show that very easily as follows.

(Refer Slide Time: 11:27)

The image shows a presentation slide with a white background and a blue border. At the top, there is a toolbar with various icons. The main content is handwritten in blue ink. A green arrow points from the text 'unit - Norm vector.' to the first term in the equation. The equation is:
$$\tilde{x}^H \cdot \tilde{x} = \frac{\bar{x}^H}{\|\bar{x}\|} \cdot \frac{\bar{x}}{\|\bar{x}\|}$$
$$= \frac{\|\bar{x}\|^2}{\|\bar{x}\|^2} = 1$$

$$\Rightarrow \|\tilde{x}\|^2 = 1$$
$$\Rightarrow \boxed{\|\tilde{x}\| = 1}$$

At the bottom right of the slide, there is a small text '6 / 95'.

In fact, if you look at $\tilde{x}^H \tilde{x}$ that is \bar{x}^H divided by norm \bar{x} times, \bar{x} divided by norm \bar{x} is basically $\bar{x}^H \bar{x}$ that is norm \bar{x} square divided by norm \bar{x} square which is 1. So, this implies now $\tilde{x}^H \tilde{x}$ is nothing but norm \tilde{x} square. So, this implies norm \tilde{x} square equals 1 that this implies norm of \tilde{x} equals 1 ok.

So, \tilde{x} is basically unit norm vector. You can also say this is the unit norm vector in the direction of \bar{x} . So, if you think of this n dimensional vector \bar{x} as representing a particular direction in n dimensional space, the unit norm vector can think can be thought of as a unit vector basically pointing in that direction, in n dimensional space. That is the direction given by the vector \bar{x} , ok. So, \bar{x} and \tilde{x} , both are a line except that \tilde{x} in this vector is a unit norm vector that is as it has norm equal to unity,.

Let us take a simple example to understand this.

(Refer Slide Time: 12:49)

The image shows a whiteboard with handwritten mathematical derivations. At the top, there is a toolbar with various drawing tools. Below the toolbar, the text reads: $\Rightarrow \|x\|$. The main derivation starts with an example: $\text{ex: } \bar{x} = \begin{bmatrix} 1 \\ 1 \\ \vdots \\ 1 \end{bmatrix} \in \mathbb{R}^n$. This is followed by the calculation of the norm: $\|\bar{x}\| = \sqrt{1+1+\dots+1} = \sqrt{n}$. Then, the square of the norm is shown: $\|\bar{x}\|^2 = n$. Finally, the unit norm vector is derived: $\tilde{x} = \frac{\bar{x}}{\|\bar{x}\|} = \frac{1}{\sqrt{n}} \begin{bmatrix} 1 \\ 1 \\ \vdots \\ 1 \end{bmatrix}$. A yellow arrow points from the text "unit Norm vector" to the final vector expression. The bottom right corner of the whiteboard shows "6 / 95".

For instance, let us consider the vector \bar{x} , let us consider this to be your \bar{x} equals the all 1 vector that is n dimensional n dimensional all 1 vector. Then, we have norm of \bar{x} equals square root of 1 square, that is 1 plus 1 plus 1, n times that is equal to square root of n . In fact, norm \bar{x} square remember, we are talking about 1 2, norm \bar{x} square equals n .

And in fact, \tilde{x} equals \bar{x} divided by norm of \bar{x} that is 1 over square root of n into the vector that is one vector of all one. So, this is basically the corresponding unit norm this is the corresponding unit norm vector, all right. So, that is basically that completes a brief summary right of the properties of the various aspects the various properties of vectors and most of you might already be familiar with many of these aspects, but this presents brief summary and we will quickly refresh your memory and remind you of several of these aspects,. So now, let us look at matrices.

(Refer Slide Time: 14:39)

MATRICES:

$A = m \times n$ matrix
 \Rightarrow m rows
 n columns.

$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1m} \\ a_{21} & a_{22} & \dots & a_{2m} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}$

m rows n columns.

Once again, a brief review of various concepts in linear algebra and matrices. So, let us consider m cross n matrix A . This implies A has m rows and n columns and you can represent A as the matrix a_{11}, a_{12} so on up to a_{1n} ; a_{21}, a_{22} so on up to a_{2n} and the m th row is a_{m1}, a_{m2} so on up to a_{mn} . So, you can see there are m rows. So, there are m rows and there are n columns.

(Refer Slide Time: 16:05)

$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1m} \\ a_{21} & a_{22} & \dots & a_{2m} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}$

m rows n columns.

$a_{ij} =$ element in i -th row & j -th column

If $m = n$
Then, $A =$ Square matrix

And note that this quantity for instance, the i th element, a_{ij} equals the element in i th row and the j th column. This is the element in the i th row and the j th column.

And, when the number of rows is equal to number of columns that is m equal n , then the matrix A becomes a square matrix ok. So, if m equal to n , then the matrix A is a square matrix that is when the number of rows is equal to the number of columns. Let us now look at an important concept of the row space and column space. Now to first understand this concept of a row space and column space of a matrix, you have to understand what we mean by, what we mean by the space and what you mean by the rank of a set of vectors.

(Refer Slide Time: 17:36)

So, let us start with this notion of rank. So, let us consider vectors \vec{w} bar, consider \vec{w} bar 1, \vec{w} bar 2 so on up to \vec{w} bar m . This is a set of this is a set of m vectors. Then, now these vectors are linearly independent. Now this is an important concept.

So, these are linearly independent, if there do not exists C_1, C_2 so on up to C_m , not all 0 that is all of them cannot be 0, they do not exists C_1, C_2, C_m not all 0 such that such that $C_1 \vec{w}$ bar 1 plus $C_2 \vec{w}$ bar 2 plus so on plus $C_m \vec{w}$ bar m equals 0. That is there cannot be set of constant C_1, C_2, C_m such that $C_1 \vec{w}$ bar 1 plus $C_2 \vec{w}$ bar 2 so on so forth up to $C_m \vec{w}$ bar m equals 0 all right, that this is known as a linear combination. So, they cannot be a linear combination of this vectors \vec{w} bar 1, \vec{w} bar 2, \vec{w} bar m that equals 0.

So, this is basically a linear combination, that is your weighing them by coefficients and adding them.

(Refer Slide Time: 20:01)

Linear Independence (LI)

Linearly independent if ~~there do NOT exist~~ c_1, c_2, \dots, c_m (NOT all zero) such that

$$c_1 \bar{w}_1 + c_2 \bar{w}_2 + \dots + c_m \bar{w}_m = 0$$

Linear Combination

8 / 95

So, this is basically a linear combination, ok. So, there cannot be a linear combination of vectors $\bar{w}_1, \bar{w}_2, \dots, \bar{w}_m$ with coefficient c_1, c_2, \dots, c_m or weight c_1, c_2, \dots, c_m such that not all of them are 0 all right, not with all them not 0 such that not all of them are 0. Let us such that this linear combination is 0 else they are linearly independent, all right.

(Refer Slide Time: 20:40)

Linear Dependence:

Linearly dependent if ~~there~~ exist c_1, c_2, \dots, c_m NOT all zero, such that

$$c_1 \bar{w}_1 + c_2 \bar{w}_2 + \dots + c_m \bar{w}_m = 0$$

Linear Combination

9 / 95

Now, what is linearly independent, linearly dependent, else they are linearly dependent.

Or let us look at this concept of linear dependence. They are linearly dependent, linearly dependent if there exists if there exist C_1, C_2, C_m not all 0 with or such that such that $C_1 \bar{W}_1 + C_2 \bar{W}_2 + \dots + C_m \bar{W}_m = 0$.

So, if there exists these weights C_1, C_2, C_m such that not all of them are 0 and the linear combination of the vectors $\bar{W}_1, \bar{W}_2, \bar{W}_m$ is 0, then these vectors $\bar{W}_1, \bar{W}_2, \bar{W}_m$ are linearly dependent ok. So, this is basically a linear combination and these vectors are therefore, linearly dependent ok. For instance, let us take a very simple example to understand this.

(Refer Slide Time: 22:49)

exist C_1, C_2, \dots, C_m NOT all zero, such that

$$C_1 \bar{W}_1 + C_2 \bar{W}_2 + \dots + C_m \bar{W}_m = 0$$

Linear Combination

Ex: $\bar{W}_1 = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$ $\bar{W}_2 = \begin{bmatrix} -2 \\ -2 \\ -2 \end{bmatrix}$

$$2 \cdot \bar{W}_1 + 1 \cdot \bar{W}_2 = 0$$

$\Rightarrow \bar{W}_1, \bar{W}_2$ are Linearly Dependent

Consider the vectors \bar{W}_1 equals 1, 1, 1 and \bar{W}_2 equals minus 2, minus 2, minus 2, then you have \bar{W}_1 plus you have two times, you can easily see two times \bar{W}_1 plus one times \bar{W}_2 equal 0; implies, \bar{W}_1 comma \bar{W}_2 are linearly dependent, these are linearly dependent.

(Refer Slide Time: 23:44)

The image shows a whiteboard with handwritten mathematical notes. At the top, it says $\Rightarrow \bar{w}_1, \bar{w}_2$ are Linearly Dependent. Below that, two vectors are defined: $\bar{w}_1 = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$ and $\bar{w}_2 = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$. A claim is made that \bar{w}_1, \bar{w}_2 are linearly independent. This is followed by a statement: \Rightarrow There do NOT exist c_1, c_2 (NOT both zero) such that $c_1 \bar{w}_1 + c_2 \bar{w}_2 = 0$. The whiteboard has a toolbar at the top and a page number '10' at the bottom.

Now, on the other hand, if consider another example, \bar{w}_1 equals 1, 1, 1 and \bar{w}_2 equals well 1, 2, 3, you can quickly verify that you can check \bar{w}_1 comma \bar{w}_2 are linearly independent all right; implies that there do not exist c_1 comma c_2 both not 0 or not both 0, not both 0 that is one of them both, one of them can be 0 such that $c_1 \bar{w}_1$ plus $c_2 \bar{w}_2$ equals 0, ok.

They do not exists, these weights such that the linear combination is 0, ok. So, basically this is the concept of linear dependence and linear independence of a set of vectors. Now, if you go back and look at the matrix A now one reduces concept of linear independence to define the rank of the matrix A.

(Refer Slide Time: 25:34)

The image shows a handwritten slide with a white background and a blue border. At the top, there is a toolbar with various icons. The main content consists of two parts. The first part shows the matrix A defined as $A = [\bar{a}_1, \bar{a}_2, \dots, \bar{a}_n]$, where $\bar{a}_1, \bar{a}_2, \dots, \bar{a}_n$ are row vectors. Below this, it is shown as $A = \begin{bmatrix} \bar{a}_1^T \\ \bar{a}_2^T \\ \vdots \\ \bar{a}_m^T \end{bmatrix}$, where $\bar{a}_1^T, \bar{a}_2^T, \dots, \bar{a}_m^T$ are column vectors. A pink arrow points to the right side of the first equation with the label "n columns". Another pink arrow points to the right side of the second equation with the label "m rows". The second part of the slide defines the "Column rank of A" as the "maximum number of linearly independent" columns.

So, let us go back and look at the matrix A as a set of remember it as n columns it is an n cross n matrix. So, you can either look at it as n columns or you can either look at it as you can either look at it as m rows ok. So, you have a 1 tilde, let us say denotes the rows a_2 tilde and. So, these are basically your n columns and these are basically your m rows and the now column rank of A equals the maximum number of linearly independent columns that is a bar 1, a bar 2 up to a bar n . That is the maximum number of linearly independent maximum number of columns that you can choose from A such that the linear combination such that they do does not exist any linear combination which is 0.

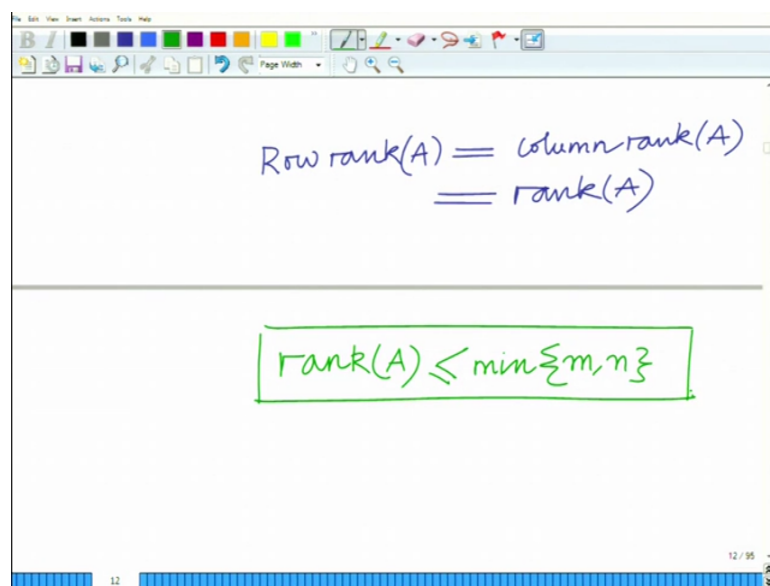

(Refer Slide Time: 27:24)

The image shows a handwritten slide with a white background and a blue border. The main content consists of two parts. The first part defines the "Column rank of A" as the "maximum number of linearly independent columns of A". The second part defines the "Row rank of A" as the "maximum number of linearly independent rows of A".

So, maximum number of linearly independent columns of A. Now, similarly the row rank of A equals the maximum number of linearly independent rows of A.

So, this is the column rank of A and this is the row rank of A. So, you have this notion of row rank and you have the notion of column rank and one of the fundamental results in linear algebra or matrix theory is that the row rank of any matrix equals the column rank and this quantity simply denoted by the rank of the row rank equals column rank which is simply denoted by the rank of the matrix A, ok.

(Refer Slide Time: 28:45)

$$\text{Row rank}(A) = \text{column rank}(A) \\ = \text{rank}(A)$$

$$\text{rank}(A) \leq \min\{m, n\}$$

So, we have the fundamental result and this should be available any standard textbook or linear algebra that is the row rank equals the row rank of any matrix A equals column rank and this is therefore, simply denoted as the rank of matrix A. And in addition this also satisfies, the property that the rank of the matrix A is less than or equal to that is let me just write this again rank of the matrix A is less than or equal to the minimum of the number of columns comma rows of A. So, the rank of A is less than or equal to minima of m comma n where m remember is number of rows and n equals number of columns.

(Refer Slide Time: 29:48)

The image shows a whiteboard with a green box containing the formula $\text{rank}(A) \leq \min\{m, n\}$. Below the box, there are two arrows pointing to 'm' and 'n' with the labels '# rows' and '# columns' respectively. A second purple box contains the text: 'rank \leq minimum of number of rows & columns of the matrix.' The whiteboard interface includes a toolbar at the top and a status bar at the bottom showing '12 / 95'.

So, rank of any matrix is less than or equal to minimum of the number of rows and columns of the matrix and this, the fundamental property of the matrix ok.

So, this is one of the fundamental properties of the matrices which again some of you might already be familiar with, all right. So, the all right. So, we have this notion of column rank which is the maximum number of linearly independent columns, the row rank; which is the maximum number of linearly independent rows and the fundamental theorem is that the row rank of the matrix of any matrix is equals is equal to it is columns rank which is simply denoted by the rank of the matrix A.

And further, this rank has to be less than or equal to the minimum of the number of rows and columns of the matrix all right. So, we have come covered some of the mathematical preliminaries required to develop the various the various tools and techniques for optimization. We will continue this discussion in the subsequent modules.

Thank you very much.
