Gram-Schmidt orthogonalization

Hello, welcome to another module in this massive open online course. So, today let us continue our discussion with Gram-Schmidt procedure for orthogonalization or orthonormalization.

(Refer Slide Time: 00:28)

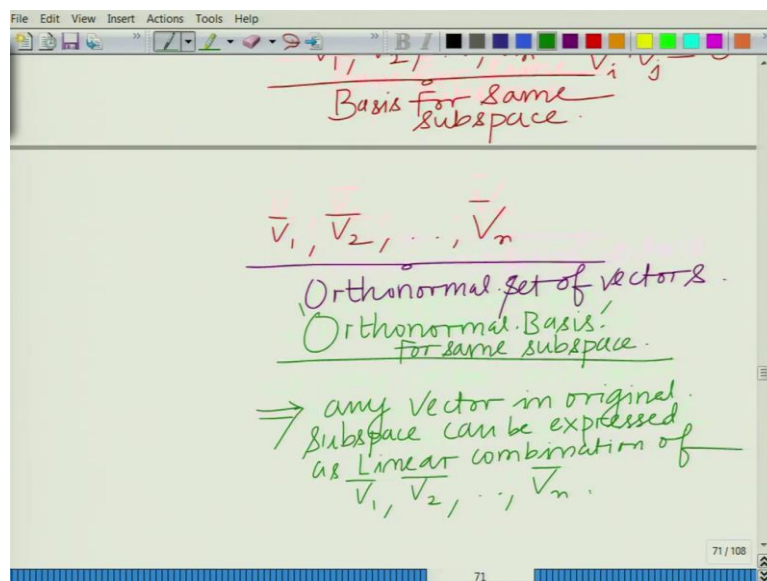

So, I am going to describe more about it so, let us talk about the Gram-Schmidt procedure. This is a procedure for orthogonalization the procedure for orthogonalization, what is the

Gram-Schmidt procedure. The procedure basically follows let us say we have a basis for a subspace that is basically given by the vectors $\bar{x}_1, \bar{x}_2, \dots, \bar{x}_n$ this is a basis.

Now, from this, this can be any basis now, from this we obtain for the same subspace given basis for subspace let us say given basis for a subspace. Now, for the same subspace we obtain another basis $\bar{v}_1, \bar{v}_2, \dots, \bar{v}_n$ such that now, this is a basis for the same subspace such that, $\bar{v}_i \cdot \bar{v}_j = 1$ if $i=j$ and $\bar{v}_i \cdot \bar{v}_j = 0$ if $i \neq j$ that is each vector has unit norm and vectors are orthogonal so, the vectors are orthonormal.

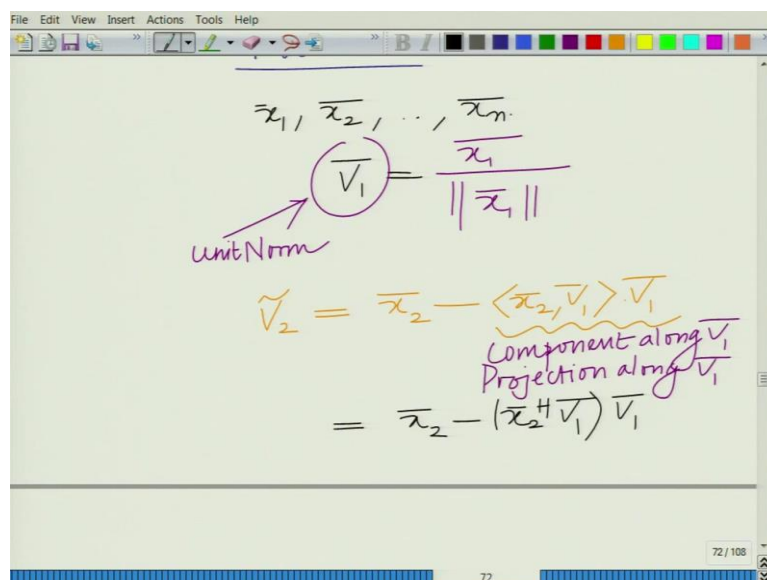

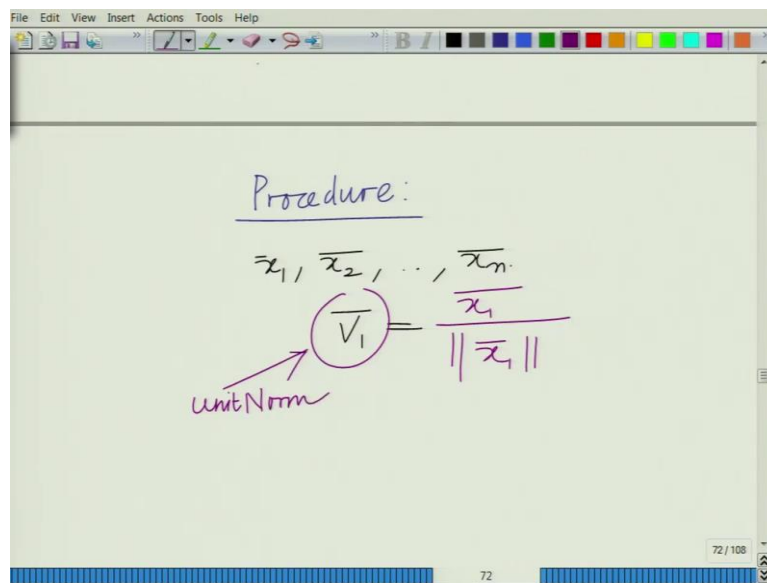

(Refer Slide Time: 02:27)

So, we say $\bar{v}_1, \bar{v}_2, \dots, \bar{v}_n$ these are orthonormal set of vectors orthogonal and unit norm. So, this is an orthonormal set of vectors and more importantly this basis is an orthonormal basis so, what do we mean by an orthonormal basis? It is a basis for the same subspace as $\bar{x}_1, \bar{x}_2, \dots, \bar{x}_n$ that is essentially the subspace you might recall is basically the span of all these vectors so, it is spanned by all these vectors essentially it is formed by the linear combinations of $\bar{x}_1, \bar{x}_2, \dots, \bar{x}_n$.

So, what we have said so, what the Gram-Schmidt procedure gives you is another equivalent basis $\bar{v}_1, \bar{v}_2, \dots, \bar{v}_n$ but, with the property that, these vectors have unit norm and they are orthogonal to each other that is it is an orthonormal basis and spans the same subspace that is any vector in the original subspace can be expressed as a linear combination of $\bar{v}_1, \bar{v}_2, \dots, \bar{v}_n$. So, orthonormal basis for same subspace for the same this implies original vector original subspace can be expressed as linear combination of $\bar{v}_1, \bar{v}_2, \dots, \bar{v}_n$.

(Refer Slide Time: 04:44)

So, how do we obtain this orthonormal subspace what is the procedure, the Gram-Schmidt procedure is as follows we start with so, we are given \bar{x}_1 \bar{x}_2 bar up to \bar{x}_n bar, we start with \bar{v}_1 bar equals \bar{x}_1 bar divided by norm of \bar{x}_1 bar so, this is the first one you can see \bar{v}_1 bar now, this \bar{v}_1 bar you can see this will be unit norm because, you are taking \bar{x}_1 bar dividing it by norm of \bar{x}_1 bar so, you can take so, you can clearly see this will be unit norm.

Now, the second vector has to be now, \bar{v}_2 bar now, first we will form this vector \bar{v}_2 tilde \bar{v}_2 tilde is formed by taking \bar{x}_2 bar and subtracting from \bar{x}_2 bar the component along \bar{v}_1 bar this is important \bar{x}_2 bar which is given by the inner product \bar{x}_2 bar \bar{v}_1 bar times \bar{v}_1 bar this is essentially what we are calling as the component or projection along \bar{v}_1 bar, we will mark or

the projection along \bar{v}_1 which is equal to \bar{x}_2 minus \bar{x}_2 bar, this is essentially nothing but, \bar{x}_2 hermitian \bar{v}_1 bar times \bar{v}_1 bar this is the projection of \bar{x}_2 bar along the \bar{v}_1 bar.

So, this is essentially the so you are removing the component and therefore, what you can show so, what you are doing is from \tilde{v}_2 from \bar{x}_2 bar, you are removing the component that is along \bar{v}_1 bar so, what is remaining will be perpendicular or orthogonal to \bar{v}_1 bar.

(Refer Slide Time: 07:23)

Projection along \bar{v}_1

$$= \bar{x}_2 - (\bar{x}_2^H \bar{v}_1) \bar{v}_1$$

\tilde{v}_2 is \perp to \bar{v}_1
 \tilde{v}_2 is orthogonal to \bar{v}_1

$$\bar{v}_2 = \frac{\tilde{v}_2}{\|\tilde{v}_2\|}$$

unit norm
 \perp orthogonal to \bar{v}_1

So, \tilde{v}_2 you can verify \tilde{v}_2 is perpendicular to \bar{v}_1 or \tilde{v}_2 is essentially orthogonal to \bar{v}_1 . Therefore, now so, you have \tilde{v}_2 is orthogonal to \bar{v}_1 , now, we need the unit norm \tilde{v}_2 . So, unit norm \tilde{v}_2 now, you get the \bar{v}_2 is simply taking \tilde{v}_2 and dividing this by the norm of \tilde{v}_2 so, that will make way to \tilde{v}_2 unit norm as well as orthogonal to \bar{v}_1 plus because, \tilde{v}_2 is all already orthogonal to \bar{v}_1 , \bar{v}_2 will also be orthogonal to.

So, at every step you are removing the projections are long the orthonormal basis already found which makes the resulting vector or orthogonal to the previously determined orthonormal vectors and then finally you divided by the norm to make it unit norm.

(Refer Slide Time: 09:05)

The image shows a digital whiteboard with handwritten mathematical formulas. The top section shows the derivation for \tilde{v}_3 and \bar{v}_3 . The bottom section shows the general derivation for \tilde{v}_i and \bar{v}_i .

$$\tilde{v}_3 = \bar{x}_3 - \langle \bar{x}_3, \bar{v}_1 \rangle \bar{v}_1 - \langle \bar{x}_3, \bar{v}_2 \rangle \bar{v}_2$$

$$\bar{v}_3 = \frac{\tilde{v}_3}{\|\tilde{v}_3\|}$$

$$\tilde{v}_i = \bar{x}_i - \sum_{j=1}^{i-1} (\bar{x}_i^H \bar{v}_j) \bar{v}_j$$

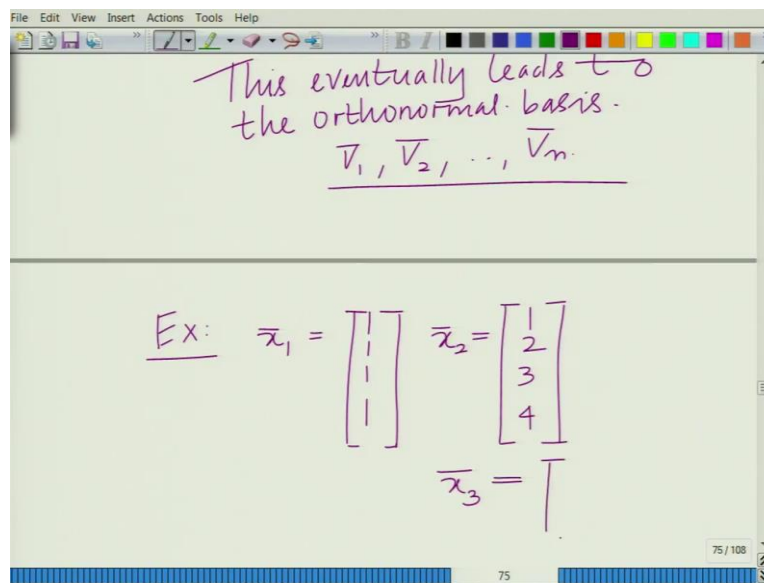

Removing components
along $\bar{v}_1, \bar{v}_2, \dots, \bar{v}_{i-1}$

$$\bar{v}_i = \frac{\tilde{v}_i}{\|\tilde{v}_i\|}$$

So similarly, we will have again going through the same procedure you will have \tilde{v}_3 this is equal to \bar{x}_3 minus the inner product of \bar{x}_3 comma \bar{v}_1 with \bar{v}_1 minus \bar{x}_3 comma \bar{v}_2 with \bar{v}_2 and therefore, your \bar{v}_3 will be equal to \tilde{v}_3 divided by the norm of \tilde{v}_3 , \tilde{v}_3 divided by the norm of \tilde{v}_3 .

And similarly we will have \tilde{v}_i is equal to \bar{x}_i minus summation j equal to 1 to i minus 1 \bar{x}_i hermitian \bar{v}_j times \bar{v}_j minus \bar{v}_j so, you are removing the projections along or removing components along \bar{v}_1 \bar{v}_2 \bar{v}_i minus 1 and finally, we have \bar{v}_i equals \tilde{v}_i divided by norm \tilde{v}_i so, this essentially eventually so, this eventually results in the orthonorm.

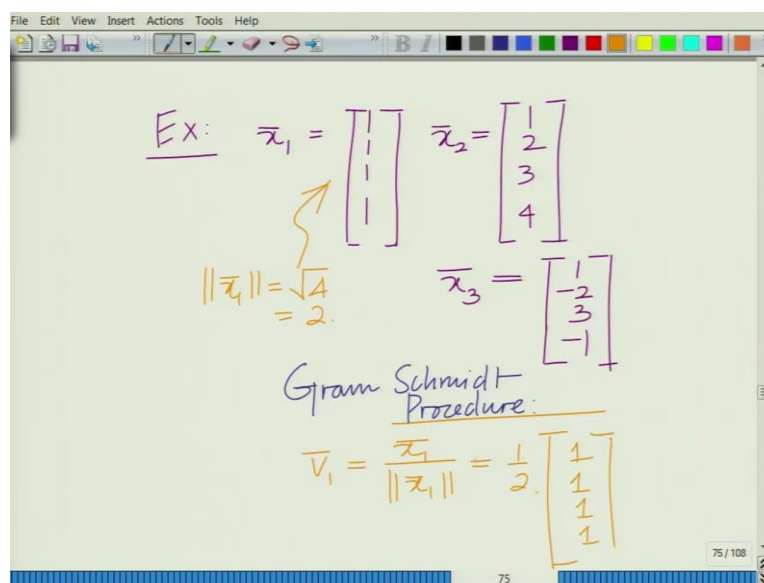

(Refer Slide Time: 11:06)

So, this leads to the orthonormal basis $\bar{v}_1 \bar{v}_2$ this eventually leads to the orthonormal basis $\bar{v}_1 \bar{v}_2 \bar{v}_n$. So, essentially at every stage you are removing the projections along the previously determined orthonormal vectors and then finally, you are dividing it by its own norm to make it so, this makes it orthogonal to the previously determined orthonormal vectors and then finally you divided by its norm to make it unit norm.

Let us take a simple example to understand this better so, let us take a simple example, we have \bar{x}_1 equals 1 1 1 1 and \bar{x}_2 equals 1 2 3 4.

(Refer Slide Time: 12:46)

And \bar{x}_3 equals $1 - 2 - 3 - 1$ and therefore, we have now to start the Gram-Schmidt procedure. Now, we want to do the Gram-Schmidt procedure. Now therefore, we have, remember the first one is very simple \bar{v}_1 equals simply take \bar{x}_1 divided by its norm to make unit norm we have \bar{x}_1 equal to $1 \ 1 \ 1 \ 1$ so, norm of \bar{x}_1 if you look at this is equal to square root of 4 equal to 2. So, \bar{v}_1 will be $1/2$ times the vector \bar{x}_1 which is essentially this is your \bar{v}_1 , what is your \tilde{v}_2 ?

(Refer Slide Time: 14:12)

The image shows a digital whiteboard with the following handwritten derivation:

$$\begin{aligned} \tilde{v}_2 &= \bar{x}_2 - (\bar{x}_2^T \bar{v}_1) \bar{v}_1 \\ &= \begin{bmatrix} 1 \\ 2 \\ 3 \\ 4 \end{bmatrix} - 5 \cdot \frac{1}{2} \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} \\ &= \begin{bmatrix} -3/2 \\ -1/2 \\ 1/2 \\ 3/2 \end{bmatrix} = \frac{1}{2} \begin{bmatrix} -3 \\ -1 \\ 1 \\ 3 \end{bmatrix} \end{aligned}$$

Now, let us form the \bar{v}_2 equals remember, you have your \bar{x}_2 since, these are real vectors I am going to simply write $\bar{x}_2^T \bar{v}_1$ times \bar{v}_1 which is nothing but, \bar{x}_2 is $1 \ 2 \ 3 \ 4$ minus this will be $\bar{x}_2^T \bar{v}_1$ so, that will be $7 \ 2 \ 9 \ 5$ times \bar{v}_1 which is $1/2 \ 1 \ 1 \ 1 \ 1$ so, if you look at this, this is going to be basically $1 \ 2 \ 3 \ 4$ this and this you can do you can check this is going to be minus 3 by 2 minus half, half, 3 by 2 which is basically if you look at it half times minus 3 minus 1 1 comma 3 so, this is the vector and now, you obtain \bar{v}_2 by taking \tilde{v}_2 dividing it by its norm so, take \tilde{v}_2 divided by its norm.

(Refer Slide Time: 15:50)

$$\vec{v}_2 = \frac{\tilde{v}_2}{\|\tilde{v}_2\|} = \frac{1}{2\sqrt{5}} \begin{bmatrix} 3 \\ -1 \\ 3 \end{bmatrix}$$

Unit Norm Orthogonal to \vec{v}_1

$$\vec{v}_1 = \frac{1}{2} \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \quad \vec{v}_2 = \frac{1}{2\sqrt{5}} \begin{bmatrix} 3 \\ -1 \\ 3 \end{bmatrix}$$

So, this will be \vec{v}_2 which is equal to \tilde{v}_2 divided by its norm, this will be \tilde{v}_2 that is correct so, this is going to be 1 divided by and the norm of this it is not very difficult to see the norm of this if you divided by its norm we will obtain 1 over twice square root of 5 times minus 3 minus 1 1 comma 3 so, this is your \tilde{v}_2 and this is essentially unit norm. Now, let us recall the property, this is basically unit norm and orthogonal to \vec{v}_1 bar you can quickly check it you can see for instance \vec{v}_1 bar equals half you have 1 1 1 1 \vec{v}_2 bar equals 1 over twice square root of 5 minus 3 minus 1 1 comma 3.

(Refer Slide Time: 17:19)

$$\vec{v}_2^T \vec{v}_1 = \frac{1}{4\sqrt{5}} \begin{bmatrix} 3 & -1 & 3 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} = 0$$

$$\|\tilde{v}_2\| = \frac{1}{2\sqrt{5}} \sqrt{9+1+9} = \frac{1}{2\sqrt{5}} \sqrt{19} \Rightarrow \|\vec{v}_2\| = 1$$

So, you can first see norm \bar{v}_2 squared equals 1 or 20 times 1 times 9 plus 1 plus 1 plus 9 equals essentially 1 which implies norm \bar{v}_2 squared equal to 1 plus \bar{v}_2 bar transpose \bar{v}_1 bar or \bar{v}_2 bar hermitian \bar{v}_1 bar this will be equal to you can see this is equal to well you can write the constants but, it does not matter 1 over 4 square root of 5 times minus 3 minus 1 plus 1 plus 3 which is equal to 0.

(Refer Slide Time: 18:10)

The image shows a digital whiteboard with handwritten mathematical work. At the top, two vectors are defined: $\bar{v}_1 = \frac{1}{2} \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$ and $\bar{v}_2 = \frac{1}{2\sqrt{5}} \begin{bmatrix} -1 \\ 3 \\ 1 \\ 3 \end{bmatrix}$. Below these, the dot product $\bar{v}_2^T \bar{v}_1 = \frac{1}{4\sqrt{5}} [-3 -1 + 1 + 3] = 0$ is calculated. To the right, the norm of \bar{v}_2 is shown: $\|\bar{v}_2\|^2 = \frac{1}{20} [9 + 1 + 1 + 9] = \frac{1}{4}$, leading to $\|\bar{v}_2\| = \frac{1}{2}$. At the bottom, the vectors \bar{v}_2 and \bar{v}_1 are listed under the heading 'Orthonormal.'

So, \bar{v}_2 bar \bar{v}_1 bar so, you can see \bar{v}_2 bar \bar{v}_1 bar are orthonormal because, they are orthogonal to each other and the both of them have unit norm. Now, let us again find \bar{v}_3 bar again the same procedure take \tilde{x}_3 bar remove the components along \bar{v}_1 bar \bar{v}_2 bar and divided them you get \tilde{v}_3 bar divided by its norm to get \bar{v}_3 bar.

(Refer Slide Time: 18:44)

$$\begin{aligned} \tilde{v}_3 &= \bar{x}_3 - \langle \bar{x}_3, \bar{v}_1 \rangle \bar{v}_1 \\ &\quad - \langle \bar{x}_3, \bar{v}_2 \rangle \bar{v}_2 \\ &= \begin{bmatrix} 1 \\ -2 \\ 3 \\ -1 \end{bmatrix} - \frac{1}{2} \cdot \frac{1}{2} \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} \\ &\quad - \left(\frac{-1}{2\sqrt{5}} \right) \frac{1}{2\sqrt{5}} \begin{bmatrix} -3 \\ -1 \\ 1 \\ 3 \end{bmatrix} \end{aligned}$$

So, the procedure is again very so, you have v_3 tilde which is basically you start with x_3 bar minus you take x_3 bar comma v_2 bar or v_1 bar minus x_3 bar v_2 bar which is basically now, you take 1 minus 2 3 minus 1 minus half into half 1 1 1 1 minus or this will rather be you can check minus or I am going to write what is this, this projection is going to be minus 1 over twice square root of 5 1 over twice square root of 5 times minus 3 minus 1 1 3.

(Refer Slide Time: 20:07)

$$\begin{aligned} &= \begin{bmatrix} 1 \\ -2 \\ 3 \\ -1 \end{bmatrix} - \frac{1}{4} \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} + \frac{1}{20} \begin{bmatrix} -3 \\ -1 \\ 1 \\ 3 \end{bmatrix} \\ &= \frac{1}{20} \begin{bmatrix} 12 \\ -46 \\ 56 \\ -22 \end{bmatrix} \end{aligned}$$

$$\begin{bmatrix} 1 \\ -1 \end{bmatrix} \quad \begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \begin{bmatrix} 3 \end{bmatrix}$$

$$\tilde{v}_3 = \frac{1}{20} \begin{bmatrix} 12 \\ -46 \\ 56 \\ -22 \end{bmatrix}$$

$$\bar{v}_3 = \frac{\tilde{v}_3}{\|\tilde{v}_3\|} = \frac{1}{\sqrt{5880}} \begin{bmatrix} 12 \\ -46 \\ 56 \\ -22 \end{bmatrix} = \frac{1}{14\sqrt{30}} \begin{bmatrix} 12 \\ -46 \\ 56 \\ -22 \end{bmatrix}$$

Which you can write essentially now, as 1 minus 2 3 minus 1 minus 1 over 4 1 1 1 1 plus 1 over 20 minus 3 minus 1 1 comma 3 and then you can also write this as the following, you can write this as 1 over 20 and you can simplify this it is not very difficult to see this will be 1 over 20 12 minus 46 56 minus 22 and then, this is your \tilde{v}_3 or this is your \tilde{v}_3 and now, \bar{v}_3 which is equal \tilde{v}_3 divided by the norm of \tilde{v}_3 , which is equal to essentially 1 over you can calculate the square root of 5880 times 12 minus 46 56 minus 22 equals 1 over 14 square root of 30 times 12 minus 46 56 minus 22. So, this is essentially what you have so, that is essentially that brings us so, essentially now, if you look at it, we have the original set of vectors \bar{x}_1 \bar{x}_2 \bar{x}_3 .

(Refer Slide Time: 22:16)

Orthogonal Basis.

$$\frac{1}{2} \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}, \frac{1}{2\sqrt{5}} \begin{bmatrix} -3 \\ -1 \\ 1 \\ 3 \end{bmatrix}, \frac{1}{14\sqrt{30}} \begin{bmatrix} 12 \\ -46 \\ 56 \\ -22 \end{bmatrix}$$

Orthogonal Basis!

Now, after the Gram-Schmidt procedure, the orthonormal basis is given as $\frac{1}{2} \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix}$, $\frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ 3 \\ 1 \\ 1 \end{pmatrix}$, and $\frac{1}{\sqrt{14}} \begin{pmatrix} 3 \\ 12 \\ -46 \\ 12 \end{pmatrix}$, let me just write it here, $\frac{1}{\sqrt{14}} \begin{pmatrix} 12 \\ -46 \\ 56 \\ -22 \end{pmatrix}$ so, this is essentially you are as we have already said, this is an orthonormal basis that is each vector in this basis has unit norm and the vectors are orthogonal to each other.

So, the Gram-Schmidt procedure has helped us derive this orthonormal basis starting with the basis that is a general basis that is \bar{x}_1 , \bar{x}_2 , \bar{x}_3 . So, let us stop this module over here and we will continue in the subsequent modules. Thank you very much.
