

Decision Support System for Managers
Prof. Anupam Ghosh
Vinod Gupta School of Management
Indian Institute of Technology, Kharagpur

Module - 09
Decision Support System for Distribution Network Design in a Supply Network
Lecture - 44
Risk Analysis for the Distribution Network

Hello and welcome to “Decision Support Systems for Managers”! We are into module 9 that is ‘Decision Support System for Distribution Network Design in a Supply Network’ and we are into lecture 4 that is ‘Risk Analysis for the Distribution Network’; ok. In the first three, we have done first point in network designing: taxation advantage.

Second thing we learnt transshipment that is zero stop, how to model that; third thing we learnt flexibility touched upon Six Sigma; fourth thing we learned how to model flexibility and total cost in the supply chain, ok. Today we will learn risk analysis, and how it will impact my supply chain design; ok. So, let us move.

(Refer Slide Time: 01:07)

As we said, today we are covering this part; today we are covering risk analysis; ok.

(Refer Slide Time: 01:20)

(Refer Slide Time: 01:22)

You know what is risk supply chain risk? Supply chain risk is a very-very great problem; I will give a simple example; ok. Lord Inchcape, I am not able to recollect properly, but the company that he owned was Anglo Indian Steamship Company; ok.

What this company would do? This company would take all cargo by water from India or West Bengal to East Bengal ok by waterways only; what am I explaining risk, waterways India, West Bengal to East Bengal; ok.

The first war with Pakistan, East Bengal means it was still being ruled by Pakistan. Only later on did Pakistan East Pakistan become Bangladesh right ok, were free Bangladesh ok. So, what happened during the India, Pakistan war, three consecutive wars first war. Most of these vessels were in East Pakistan, most of these vessels with cargo because that time water route was very-very easy and cheap; ok.

So, most of these vessels were inside East Pakistan and the war started, East Pakistan immediately confiscated all these vessels and said this is enemy property, we will not give it back. What happened you know, Anglo Indian Steamship Company had lots and lots of vessels I do not know remember the exact number, but lots; only two vessels were on Indian soil or Indian water, all were gone East Pakistan.

Anglo Indian Steamship Company did not get back anything, war ended, agreement, so many things, negotiation did it not get back. Why? Because East Pakistan that time ruled by Pakistani Government, they had lots of rivers. In fact, Bangladesh is a river and country, but they did not have these modern cargo vessels, so they purposefully confiscated it.

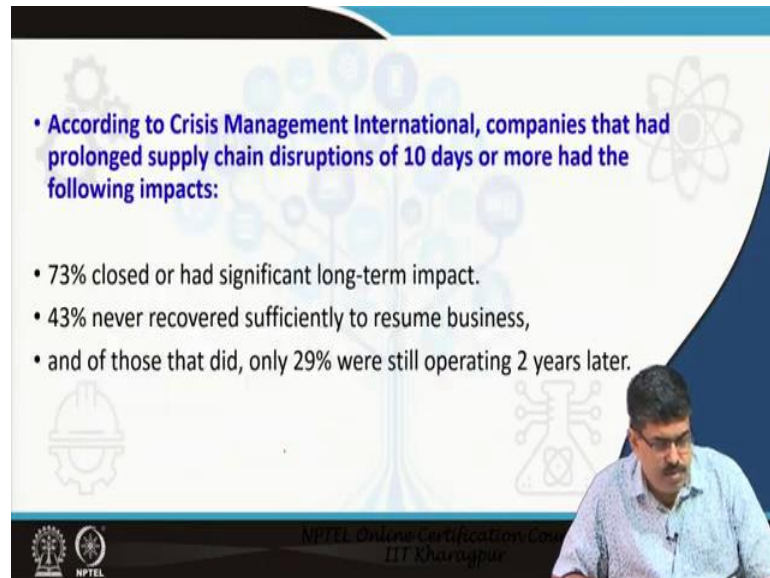

At the same way it is a win-win, because Lord Inchcape was trying to move out of India, because India had become independent; he did not feel like staying back, so he wanted to sell his business, but government said no, you cannot sell we will buy, you cannot sell to anybody we will buy. And government was giving very poor money, so this was a ploy also.

He because of his British alignment he knew very well, when will Pakistan attack; so, he purposefully ordered all his vessels to move with cargo inside East Pakistan. Now, the moment is vessels got captured by Pakistani army, because it was an East Pakistan side. Lord Inchcape wrote to the Government of India that look you told me not to sell, I have not sold my company; but all the vessels are gone you give me compensation at the market rate, because I need to buy new vessels.

So, the government had to give him compensation, he took the money and happily went back to England. What was left over of Anglo Indian Steamship Company? Only two vessels; so, government took it over took the company over and formed something called Central Inland Water Transport Corporation – CIWTC ok. So, this is what risk is, this is what risk is; ok.

Now, in supply chain setting risk is part shortage, production problem, other changes all these are risks. Risk lead to average loss of 250 million dollars in market cap. Average reduction of 10 percent in stock market price, 92 percent reduction in ROA, 7 percent lower sales very important. 11 percent increase in cost, 14 percent increase in inventory ok, risk is this data have been compiled over and over time.

(Refer Slide Time: 07:24)

• According to Crisis Management International, companies that had prolonged supply chain disruptions of 10 days or more had the following impacts:

- 73% closed or had significant long-term impact.
- 43% never recovered sufficiently to resume business,
- and of those that did, only 29% were still operating 2 years later.

NPTEL online certification Center
IIT Kharsappur

According to crisis management international companies are at prolonged supply chain disruptions of 10 days or more had the following impact. 73 percent closed or had significant long-term impact. 43 percent never recovered, and of those who did, only 29 percent were still operating 2 years later ok. So, supply chain risk is a great problem.

(Refer Slide Time: 07:58)

• The major causes of supply chain disruptions:

- Weather (51%)
- IT failure (41%)
- Transportation network disruption (21%)
- Earthquake/Tsunami (21%)

NPTEL Online Certification Course
IIT Kharygpur

Major causes weather, most important. IT failure, person A's product going to person B, product in stock; but your computer system is showing no stock that is type 1. Type 2 error, computer is showing stock, but product is not there; nobody will believe, everybody will say computer is right. There is a product you do not know, but in reality the product is not there on the shelf at that time; ok, so IT failure.

Transportation network disruptions - any cyclone our planning for the coastal areas transportation planning and all disappears, gets disrupted. Earthquake, Tsunami we just mentioned 21 percent; ok. Transportation network disruption another is road blockages, any problem you come and block the road, so road blockages; ok.

(Refer Slide Time: 09:17)

• Where did the supply chain disruptions occur:

- 61% at Tier 1 suppliers
- 30% at Tier 2
- 9% at Tier 3 or lower

The slide features a background with a stylized tree diagram where nodes represent different tiers of suppliers. The text is positioned on the left side of the slide. The NPTEL logo and 'NPTEL Online Certification Course IIT Khargapur' are visible at the bottom.

Now, where exactly the supply chain disruptions occur? 61 percent at tier 1 suppliers that means that the bill starting point ok, the most important one; 30 percent at tier 2, so 90 percent problem is solved; 9 or lower percentage at tier 3; ok, tertiary.

(Refer Slide Time: 09:43)

Risk Identification.....

1. Financial risks
2. Strategic risks
3. Hazard risks
4. Operational risks

The slide features a background with a stylized tree diagram. The text is positioned on the left side of the slide. The NPTEL logo and 'NPTEL Online Certification Course IIT Khargapur' are visible at the bottom.

Now risk identification - financial risks, strategic risk, hazard risk and operational risk very easy, very simple; ok.

(Refer Slide Time: 09:57)

Financial risks include :

- Interest rate fluctuations,
- Changes in currency exchange rates,
- Credit rating for company's bonds,
- Changes in accounting and tax laws.

The slide features a background with a stylized tree of icons and a gear icon. A presenter is visible in the bottom right corner. The footer includes the NPTEL logo and the text 'NPTEL Online Certification Course IIT Khargapur'.

Financial, strategic, hazards, operations. Financial risk - interest rate fluctuations, changes in currency exchange rate, credit rating, changes in accounting and tax laws, I think everything is very common.

(Refer Slide Time: 10:06)

Strategic risks include :

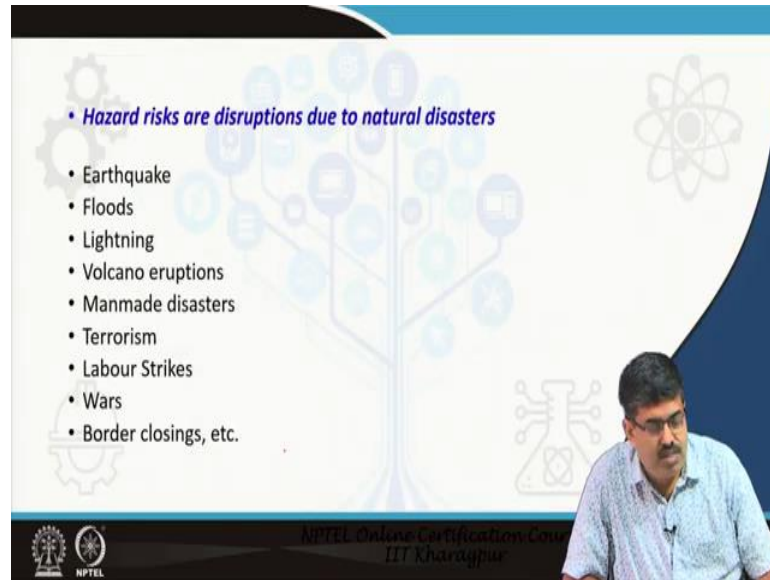

- New competitors
- Negative press coverage
- Customer demand changes
- Erosion of brand loyalty
- Poor customer relations, etc.

The slide features a background with a stylized tree of icons and a gear icon. A presenter is visible in the bottom right corner. The footer includes the NPTEL logo and the text 'NPTEL Online Certification Course IIT Khargapur'.

Strategic risks include new competitors, negative press coverage, customer demand changes, erosion of brand loyalty; ok. Strategic risk very-very important; long-term will damage your company; ok, new competitors you are not able to supply on time, because if a supply chain so new competitors have come.

Definitely negative press coverage – customer demand changes very-very quickly; how to model such a thing? Croasion of brand loyalty – because of all these, what will happen ultimately? Your brand loyalty will suffer; right; poor customer relations; right.

(Refer Slide Time: 11:09)

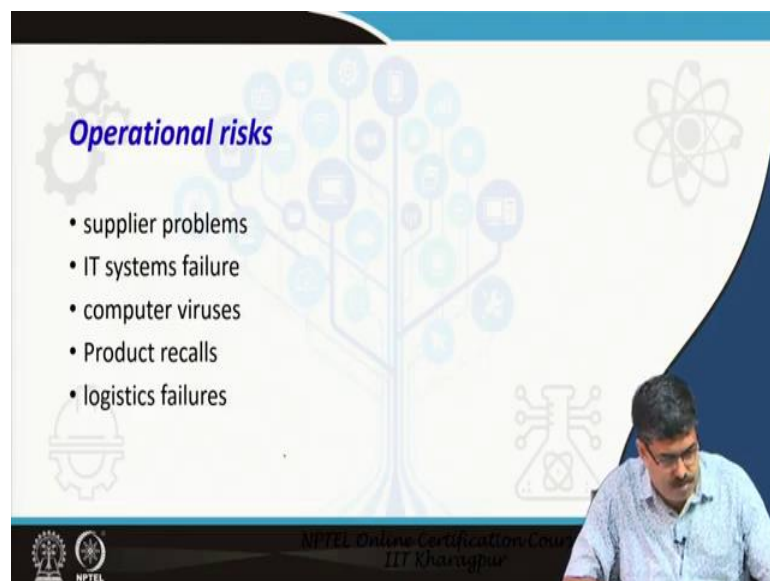

The slide features a background with a stylized tree of icons and a gear icon. The text on the slide is as follows:

- **Hazard risks are disruptions due to natural disasters**
- Earthquake
- Floods
- Lightning
- Volcano eruptions
- Manmade disasters
- Terrorism
- Labour Strikes
- Wars
- Border closings, etc.

The slide also includes the NPTEL logo and the text "NPTEL Online Certification Course IIT Kharyagpur" at the bottom.

Hazard risk; the first one was what? Sorry; financial then strategic, then hazard, then operational; ok. Hazard risk is very something which you know; hazard earthquake, flood lightning, volcano, manmade disaster, terrorism, labour strikes, war, border closing, all hazards; we do not want this all hazards; ok.

(Refer Slide Time: 11:40)

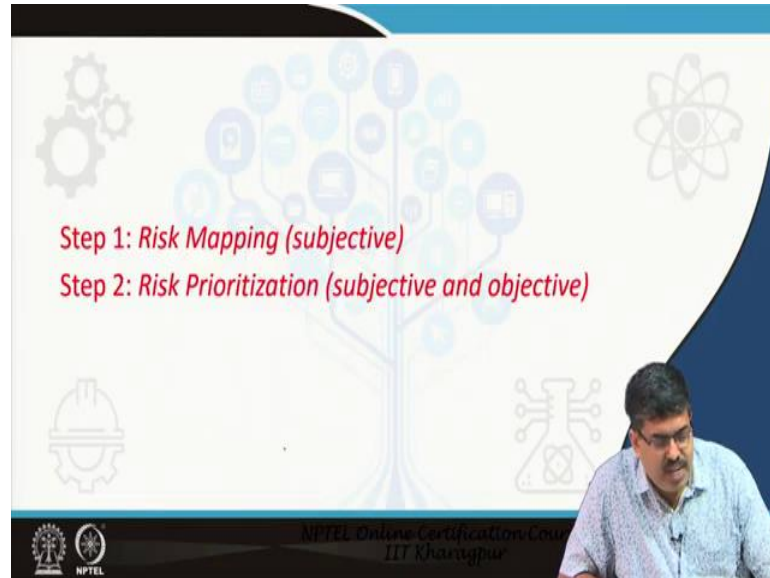

The slide features a background with a stylized tree of icons and a gear icon. The text on the slide is as follows:

- **Operational risks**
- supplier problems
- IT systems failure
- computer viruses
- Product recalls
- logistics failures

The slide also includes the NPTEL logo and the text "NPTEL Online Certification Course IIT Kharyagpur" at the bottom.

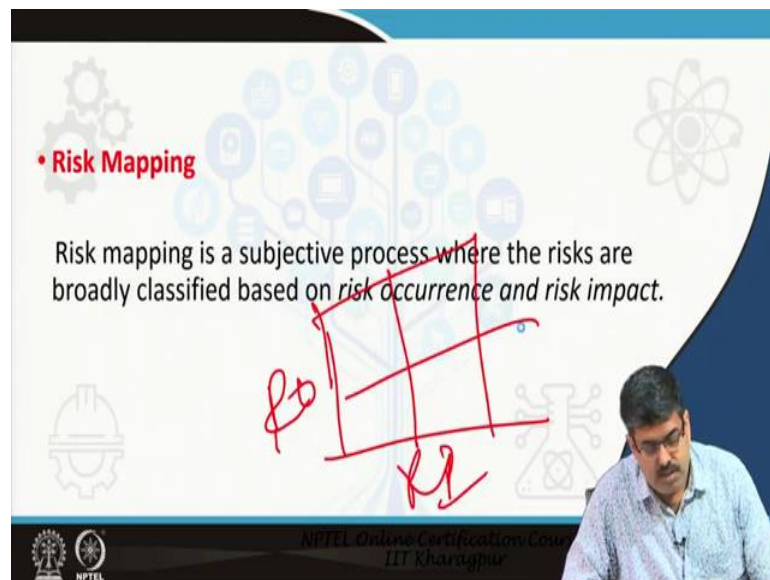

Operational risk – supplier problems, IT systems failure, computer viruses, product recalls, logistics failures; self-explanatory, not going into details; ok.

(Refer Slide Time: 11:57)

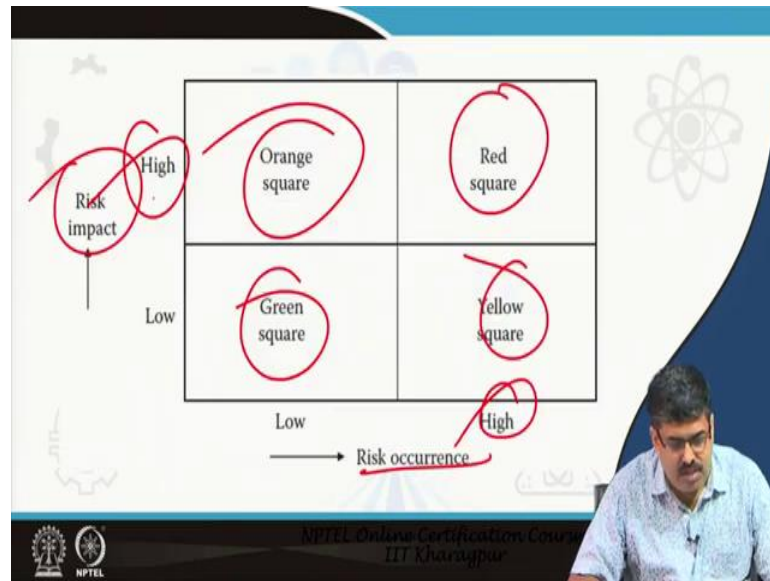

Risk assessment - risk mapping, risk prioritization. Risk mapping is a bit subjective have to put your own value judgments.

(Refer Slide Time: 12:06)

Risk mapping is subjective process where the risks are broadly classified based on risk occurrence and risk impact; so, based on risk occurrence and risk impact; ok, something like that; ok.

(Refer Slide Time: 12:23)

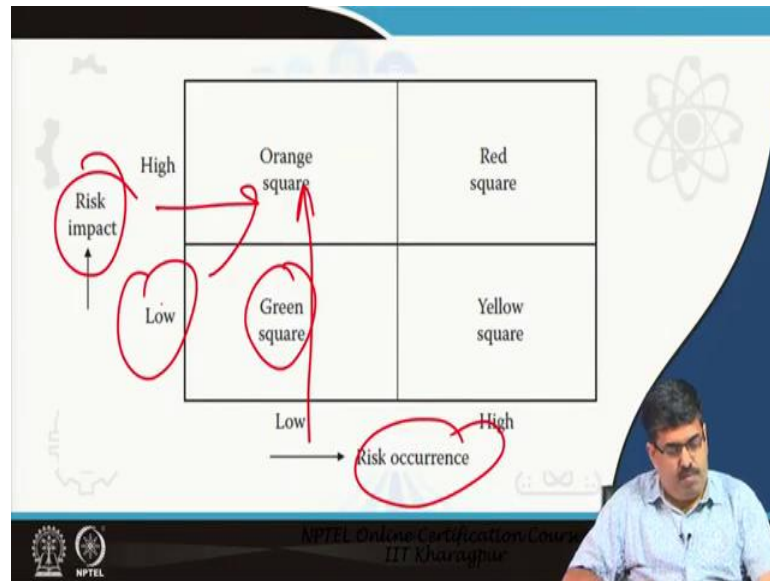

Yeah see risk occurrence, risk impact and make it red is high in risk occurrence and high in risk impact; ok; both are low get a green in between yellow and orange; ok. Now, if you see this red orange let me erase it; if you see this red and orange, etc., etc.

(Refer Slide Time: 12:54)

- Tier 1, 2, 3, ..., n supplier problems (red)
 - Loss of critical supplier (red)
 - Quality problems and product recalls (red/orange)
 - Terrorism and sabotage (orange)
 - Flooding/hurricanes/tornados (orange)
 - Union and labour problems (orange)
 - New competitor in the market (orange)
 - Customer demand (red/orange)
 - Warehouse fire (yellow/green)
- The NPTEL logo and 'NPTEL Online Certification Course IIT Kharyagpur' are visible at the bottom of the slide.

Tier 1, 2, 3 n supplier problems they are red; look at all the red all the examples of red, loss of critical supplier red, quality problems product recall if it is of the most important component, it is red; otherwise it is orange. Terrorism and sabotage orange, flooding hurricanes tornados orange, you know why these are orange?

(Refer Slide Time: 13:30)

Because go back to the table, risk occurrence is low tornadoes will not happen every day risk occurrence is low, but the impact the severities very very high, it is orange ok. Union and labour problems again orange, new competitor in the market orange, customer demand red and orange, Warehouse fire yellow and green, why green warehouse fire?

Because anyway it is insured ok; see green warehouse fire all fire yellow or green right, risk occurrence is low we do we have not seen as such warehouse fires and risk impact is also low, why? Because insurance is done all the products, employees, everybody's insurance is ready; ok.

(Refer Slide Time: 14:21)

A slide from an NPTEL presentation. The slide features a list of risk events on the left side, each followed by its severity classification in parentheses. The background is white with a blue tree-like graphic and various icons (gears, atom, person, etc.). In the bottom right corner, there is a small video inset of a man with glasses and a mustache, wearing a light blue shirt, speaking. The NPTEL logo and 'NPTEL Online Certification Course IIT Kharagpur' are visible at the bottom.

- Blizzard/Ice storm (yellow)
- IT system failure (orange)
- Logistics provider failure (yellow)
- Equipment breakdown (green)
- Product returns from customers (green)
- Temporary work stoppages (yellow)
- Computer virus (yellow/green)
- Interest rate fluctuation (yellow)
- Delivery delays (yellow)
- Defective materials (yellow/green)
- Health and safety violations (green)

Blizzard and ice storm not really in India, but abroad yes. IT systems failure yes, orange. Logistics provider failure yellow, equipment breakdown green, product returns from customers' green, temporary work stoppages yellow.

Is it these are all the risk classifications based on the severity, you can look at those matrices and do this as an exercise also, you can put your hand on it just, so that you do not see it and then you can practice it.

(Refer Slide Time: 15:01)

A slide titled 'Risk Prioritization' in red text. The background is white with a blue tree-like graphic and various icons (gears, atom, person, etc.). In the bottom right corner, there is a small video inset of the same man from the previous slide, speaking. The NPTEL logo and 'NPTEL Online Certification Course IIT Kharagpur' are visible at the bottom.

Risk prioritization ok, first risk mapping, next is see risk mapping and risk prioritization right. So, what we did here, we did risk mapping; ok.

(Refer Slide Time: 15:18)

Risk Priority Numbers:

For each risk event, a Risk Priority Number (RPN) is computed which is, the product of the numerical scores assigned to the four risk factors, occurrence, impact, detection and recovery.

$$RPN = (\text{Occurrence}) (\text{Impact}) (\text{Detection}) (\text{Recovery})$$

.....Detection and Recovery are reverse coding

Handwritten notes: "Occurrence 5" and "1/2" with arrows pointing to the Detection and Recovery terms in the formula.

NPTEL Online Certification Course
IIT Kharyga

Next is risk prioritization - for this we generate something called a Risk Priority Number – RPN. This RPN is equal to RPN is equal to occurrence impact detection recovery, detection and recovery are reverse coding means; if 5 is high 5 is highest for occurrence, for recovery it is 1, ok; for recovery it is 1 that is what we mean by reverse coding, and they have to be reconverted or the wordings of the questionnaire are to be changed, but it is not done they are to be converted; ok. So, occurrence impact detection recovery.

(Refer Slide Time: 16:08)

• The RPN Scores are then plotted in boxes/grids with orange, red, green and yellow colours

• This method is a quick estimate for assessing risks

Red	Red
Green	Yellow/Orange

NPTEL Online Certification Course
IIT Kharagpur

The RPN scores are then plotted in boxes grids with orange red green and yellow numbers, as we have seen this method is a quick estimate of assessing risk. This is red, yellow or orange, this is orange; ok; so this method is a quick estimate for assessing risks.

(Refer Slide Time: 16:32)

QUANTIFYING THE RISKS: MODELS

NPTEL Online Certification Course
IIT Kharagpur

(Refer Slide Time: 16:36)

• Value-at-Risk (VaR) type risks
• Miss-the-Target (MtT) type risks

• Risk = $f(\text{impact}, \text{occurrence})$

NPTEL Online Certification Course
IIT Kharagpur

What are the models that are available? The Value-at-Risk model, Miss-the-Target type risks and risk is a function of impact and occurrence; ok.

(Refer Slide Time: 16:47)

Type	Occurrence	Impact	Examples
Value-at-risk (VaR)	Rare	Severe	Hurricane, strike, fire, terrorist attack
Miss-the-target (MtT) risk	Frequent	Mild to moderate	Late delivery of raw materials, low quality replenishment

Simulation

NPTEL Online Certification Course
IIT Kharagpur

Let us see the VaR model and the Miss-the-Target risk, VaR models used when the risks is very rare as well as very severe. The Miss-the-target means frequent and mild to moderate, it is like the summer storms during the summer months ok; Rare and severe Value-at-Risk hurricane, strike, fire, terrorist attack, etcetera; Miss-the-target late delivery of raw materials, so the magnitude is much less, low quality replenishment; ok.

(Refer Slide Time: 17:29)

- **Simulation Approach**
- Under this approach, the number of extreme events during a given period, and their impacts are simulated and aggregated.
- Thus, each simulation run will consist of the following steps:
- Step 1: Sample from the occurrence function to generate the number of risk events during a given period
- Step 2: For each risk event, generate its impact, in terms of financial loss.
- Step 3: Sum the impacts to determine the total loss due to all the events

Simulation approach for risk under this approach, the number of extreme events during a given period, and their impacts are simulated and aggregated; extreme events and their impacts. Each simulation run will consist of the following steps; sample from the occurrence function to generate the number of risk events during a given period; ok; simulation, we do number generation.

Step 2, for each risk event; generate its impact, in terms of financial loss. So, first is generate the number of even risks, next is generated its impact and third is sum the impacts to determine the total loss due to all the events; ok.

(Refer Slide Time: 18:14)

(Refer Slide Time: 18:16)

Measuring risk – political, macro, social; input these are social; sorry, social input market.

(Refer Slide Time: 18:18)

• Fragile State Index (earlier: Failed State Index)
<http://fundforpeace.org/fsi/data/>

• Global Peace Index
<http://visionofhumanity.org/indexes/global-peace-index/>
<http://visionofhumanity.org/app/uploads/2018/06/Global-Peace-Index-2018-2.pdf>

NPTEL Online Certification Course
IIT Kharsgpur

The slide features a background with a stylized tree of icons and various symbols like gears and a globe. A presenter is visible in the bottom right corner.

These are all your some sort of a PESTEL framework that we do in strategy but yes indeed they are measurable. This is another way by which you do it fragile state index and global peace index; they also give you some idea about the risks of different countries; ok.

(Refer Slide Time: 18:44)

• Global Competitiveness Index
<http://reports.weforum.org/global-competitiveness-report-2018/>

NPTEL Online Certification Course
IIT Kharsgpur

The slide features a background with a stylized tree of icons and various symbols like gears and a globe. A presenter is visible in the bottom right corner.

Global competitiveness index is another one; ok. Is there again sum? No, vendor fail risk, this is another one.

(Refer Slide Time: 18:51)

Vendor Fail Risk =

- (Status Risk + Revenue Percent Fall + Revenue Percent Fall To All Vendors + has Contract Expired + Flood risk + Other Risk + Hurricane Risk + Earthquake Risk + Foreign Risk)
-then normalise

Vendor 500

NPTEL Online Certification Course
IIT Kharsipur

Risk is fine, this vendor is also working with me for 5 years, but what is this vendor fail risks? It is a summation of all these status, revenue, revenue fall vendors, contract expired; sorry, has contract expired everything; ok; flood risks, other risk, hurricane risk, earthquake risk, foreign risk; ok; so, all these are a part of vendor fail risk; ok.

(Refer Slide Time: 19:37)

System Impact Risk =

- (product is Non-repairable + Sole source + technical product risk +)
-then normalise

NPTEL Online Certification Course
IIT Kharsipur

System impact risk product is non-repairable, sole source, technical product risk; ok. The now if you see these are all different dimensions, these are all different units, so you have to normalize; you have to normalize; ok; that is system impact risk.

(Refer Slide Time: 19:59)

• **Product risk =**
• $\text{Vendor Fail Risk} * \text{System Impact Risk} / (\text{Days To Run Out of Stock} / 365 + 1)$.
• 1 is added to avoid a divide by '0' situation

NPTEL Online Certification Course
IIT Khargpur

Product risk - vendor failed risk into system impact risk divided by days to run out of stock divided by 365 plus 1 ok that is vendor fail risk, because vendor is failing. Now, 1 is avoided to have due to avoid a divide by 0 situation; ok; here that is product risk.

(Refer Slide Time: 20:25)

• **Miss-the-target (MtT) risk**
• The Mean and Standard Deviation comes in handy to conduct simulation analysis

NPTEL Online Certification Course
IIT Khargpur

So, if you see Miss-the-target risk, the mean and standard deviation comes in handy to conduct simulation analysis ok. So, our this thing was if you remember, Value-at-risk and Miss-the-target risk; Miss-the-target risk frequent so when it is frequent, so you can do a simulation ok, and this is the Miss-the-Target risk.

(Refer Slide Time: 21:00)

• For qualitative evaluation, AHP/ANP is helpful. This is true for global (country) risk analysis as also dealer analysis.

• For multi-echelon supply chain, simulation can be helpful.

Risks in Stock market

Finance Models

NPTEL Online Certification Course
IIT Kharagpur

For qualitative evaluation, AHP, ANP is helpful. This is true for global country risk analysis and also dealer analysis ok. For multi-echelon supply chain, simulation can be helpful; ok. So, I would suggest that you have some homework done on simulation studies, and also you learn AHP and ANP; ok, it is very easy, very-very easy; do not get afraid by software, etc.; it is very easy; ok.

So, for multi-echelon supply chain as I would suggest, you study simulation a bit and I would also suggest to study AHP, ANP that will help you; ok. AHP, ANP is also very easy; ok; there will be courses where you will learn AHP, ANP; ok.

(Refer Slide Time: 22:05)

• References:

1. Supply Chain Management: Strategy, Planning and Operation; Sunil Chopra, Peter Meindl, D V Kalra; Pearson
2. Designing and Managing the Supply Chain; David Simchi-Levi, Philip Kaminsky, Edith Simchi-Levi, Ravi Shankar; McGraw-Hill

NPTEL Online Certification Course
IIT Kharagpur

Now, these are the references; risk is pretty much research paper based study ok and this is pretty much the way you measure risk ok, now this is one aspect. The second aspect is people who are having a finance background, in finance there are lots of models that predict the risks in a stock market ok, you can adopt those models if you see there some model it is relevant here.

In fact, the models that we said all are majority of them adoptions from these risk models. So, so if you look at a risk model, you can adopt a financial risk model here also; ok; so that also you can do; ok. So, overall supply chain risk is a great problem and we all know the stories of Idi Amin, etc.

India doing a lot of business and then one fine morning, they are asked to evacuate; ok. So, risks in supply chain is great, certain routes we would love to have, because a very low cost very short distance, but situations do not allow us. For example Afghanistan, we will love to have a products via Afghanistan from the Middle East; but then international and country risk does not allow us to do that; ok.

So, there are lot of risks involved in supply chain and you should be very-very careful on how these risks are getting mapped; ok. So, this is it and as I mentioned, these are the references for this; ok. And this Chopra and Meindl has very decent references, chapters on risks. So, yeah we will end the lecture here; next class we will go ahead with the last lecture of this module of supply chain design; ok. Thank you!
