 Fractional PDEs Part 3

(Refer Slide Time: 00:16)

So, the second case I am going to talk about is the non homogeneous fractional wave equation. So, the non homogeneous fractional wave equation given by the following PDE:

$$\frac{\partial^\alpha u}{\partial t^\alpha} - c^2 \frac{\partial^2 u}{\partial x^2} = q(x, t); \quad x \in \mathbb{R}, t \geq 0$$

I am also given the following initial conditions:

$$u(x, 0) = f(x)$$

$$u_t(x, 0) = g(x);$$

$$c = \text{constant}, \quad 1 < \alpha \leq 2$$

So, which means that if it is equal to 2 I get back my classical wave equation and that solution has already been discussed. So let us now call this as my *I*. So, if I were to apply joint Fourier Laplace transform, I get to see the following solution:

$$\bar{\bar{u}}(k, s) = \frac{\tilde{f}(k) s^{\alpha-1}}{s^\alpha + ck^2} + \frac{\tilde{g}(k) s^{\alpha-2}}{s^\alpha + ck^2} + \frac{\bar{\bar{q}}(k, s)}{s^\alpha + ck^2}$$

So, then let us apply start to apply the inverse transform. So, if I were to do that I am going to get solution in the Fourier space and the physical time. So, solution in the Fourier space and physical time is given by:

$$\tilde{u}(k, t) = \tilde{f}(k) \mathcal{L}^{-1} \left[\frac{s^{\alpha-1}}{s^{\alpha} + ck^2} \right] + \tilde{g} \mathcal{L}^{-1} \left[\frac{s^{\alpha-2}}{s^{\alpha} + ck^2} \right] + \mathcal{L}^{-1} \left[\frac{\tilde{q}}{s^{\alpha} + ck^2} \right]$$

So, I need to evaluate these three Laplace transform and I can see that I can evaluate the first two Laplace transform using Mittag Leffler expansions.

(Refer Slide Time: 04:55)

Handwritten notes on a grid background showing the inverse Fourier transform of the Laplace transform solution. The notes include the definition of $\tilde{u}(k, t)$ as an integral over k , the inverse Fourier transform formula, and specific expansions for $\alpha=2$.

$$\tilde{u}(k, t) = \tilde{f}(k) E_{\alpha,1}(-c^2 k^2 t^{\alpha}) + \tilde{g}(k) [E_{\alpha,2}(-c^2 k^2 t^{\alpha})] t + \int_0^t \tilde{q}(k, t-\tau) \tau^{\alpha-1} E_{\alpha,\alpha}(-c^2 k^2 \tau^{\alpha}) d\tau$$

Inverse Fourier transform:

$$u(x, t) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \tilde{f}(k) E_{\alpha,1}(-c^2 k^2 t^{\alpha}) e^{ikx} dk + \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} t \tilde{g}(k) E_{\alpha,2}(-c^2 k^2 \tau^{\alpha}) e^{ikx} dk + \frac{1}{\sqrt{2\pi}} \int_0^t \tau^{\alpha-1} d\tau \int_{-\infty}^{\infty} \tilde{q}(k, t-\tau) E_{\alpha,\alpha}(-c^2 k^2 \tau^{\alpha}) e^{ikx} dk$$

In particular: $\alpha=2$: Regular wave Eqⁿ case.

$$E_{2,1}(-c^2 k^2 t^{\alpha}) = \cosh(ickt) = \cos(ckt)$$

$$E_{2,2}(-c^2 k^2 t^{\alpha}) = \frac{t \sinh(ickt)}{ickt} = \frac{\sin(ckt)}{ck}$$

$$u(x, t) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \tilde{f}(k) \cos(ckt) e^{ikx} dk + \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \tilde{g}(k) \frac{\sin(ckt)}{ck} e^{ikx} dk + \frac{1}{\sqrt{2\pi}} \int_0^t d\tau \int_{-\infty}^{\infty} \tilde{q}(k, \tau) \frac{\sin(kc(t-\tau))}{k} e^{ikx} dk$$

So, the solution in the Fourier transform and physical time space is:

$$\tilde{u}(k, t) = \tilde{f}(k) E_{\alpha,1}(-c^2 k^2 t^{\alpha}) + \tilde{g}(k) [E_{\alpha,2}(-c^2 k^2 t^{\alpha})] t + \int_0^t \tilde{q}(k, t - \tau) \tau^{\alpha-1} E_{\alpha,\alpha}(-c^2 k^2 \tau^{\alpha}) d\tau$$

So, if I were to start applying the inverse Fourier transform the first two inverse transforms are quite straightforward in application. I see that my solution is:

$$u(x, t) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \tilde{f}(k) E_{\alpha,1}(-c^2 k^2 t^{\alpha}) e^{ikx} dk + \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} t \tilde{g}(k) E_{\alpha,2}(-c^2 k^2 t^{\alpha}) e^{ikx} dk + \frac{1}{\sqrt{2\pi}} \int_0^t \tau^{\alpha-1} d\tau \int_{-\infty}^{\infty} \tilde{q}(k, t - \tau) E_{\alpha,\alpha}(-c^2 k^2 \tau^{\alpha}) e^{ikx} dk$$

So, I have three integrals to evaluate note that now from here onwards if I were to evaluate this I need to know the specific form of f, g and q , and once we know the specific form I can find the Fourier transform plug it into the integral and evaluate this inverse transform.

If we talk about a special case, the special case is when $\alpha = 2$, then the regular wave equation is :

$$E_{2,1}(-c^2 k^2 t^{\alpha}) = \cosh(ickt) = \cos(ckt)$$

$$E_{2,2}(-c^2 k^2 t^{\alpha}) = \frac{t \sinh(ickt)}{ickt} = \frac{\sin(ckt)}{ck}$$

So, , now, substituting both these expansion for $\alpha = 2$, I get that my solution is:

$$u(x, t) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \tilde{f}(k) \cos(ckt) e^{ikx} dk + \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \tilde{g}(k) \frac{\sin(ckt)}{ck} e^{ikx} dk + \frac{1}{\sqrt{2\pi}} \frac{1}{c} \int_0^t d\tau \int_{-\infty}^{\infty} \tilde{q}(k, \tau) \frac{\sin(kc(t-\tau))}{k} e^{ikx} dk$$

Let me call this as II' because this is a particular case.

(Refer Slide Time: 13:07)

$$\begin{aligned}
 \textcircled{II'} : u(x,t) &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \tilde{f}(k) \cos(kt) e^{ikx} dk + \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \tilde{g}(k) \frac{\sin(kt)}{k} e^{ikx} dk \\
 &+ \frac{1}{\sqrt{2\pi}} \frac{1}{c} \int_{-\infty}^t d\tau \int_{-\infty}^{\infty} \tilde{q}(k, \tau) \frac{\sin kc(t-\tau)}{k} e^{ikx} dk \\
 &= \frac{1}{2} [f(x-ct) + f(x+ct)] + \frac{1}{2c} \int_{x-ct}^{x+ct} g(\xi) d\xi + \frac{1}{2c} \int_0^t d\tau \int_{x-c(t-\tau)}^{x+c(t-\tau)} q(\xi, \tau) d\xi \\
 &\rightarrow \text{De Alembert's sol'n.}
 \end{aligned}$$

So, then note that in the first case if I were to replace my $\cos(kt)$ by $(e^{ikt} + e^{-ikt})/2$ and then we get,

$$= \frac{1}{2} [f(x-ct) + f(x+ct)] + \frac{1}{2c} \int_{x-ct}^{x+ct} g(\zeta) d\zeta + \frac{1}{2c} \int_0^t d\tau \int_{x-c(t-\tau)}^{x+c(t-\tau)} q(\zeta, \tau) d\zeta$$

So, this is nothing but the well known De Alembert's solution for the wave equation that we had found earlier for the regular wave equation. So, with this example I conclude our discussion on the fractional ODE's; however, I continue my discussion on my fractional PDE's namely we will see some special PDE's in arising in fluids in signal processing and in quantum mechanics in my next lecture.
