**Lagrange Interpolation Polynomial Error in Interpolation 1**

(Refer Slide Time: 0:42)

We consider now error in interpolation, suppose that  $n$  is greater than or  $= 0$  and that  $f$  is a real value continuous function defined on the closed interval  $a, b$  and that the derivatives of  $f$  of order  $n + 1$  exist and is continuous on the closed interval  $a, b$ . Let  $x$  belong to the close interval  $a, b$ , then there exists a  $\xi$  which depends on  $x$  belonging to the open interval  $a, b$  such that  $f(x) - P_n(x)$  the interpolating polynomial of degree at most  $n$  that interpolates this function  $f(x)$  this, the  $n + 1$  derivative of  $\xi$  by  $n + 1$  factorial into  $P_{n+1}$  of  $x$ .

Where  $P_{n+1}$  of  $x$  is  $(x - x_0)(x - x_1) \dots (x - x_n)$  this is a polynomial of degree  $n + 1$  there are  $n + 1$  such factors of the form  $x - x_0, x - x_1, \dots, x - x_n$ . So  $P_{n+1}$  of  $x$  is a polynomial of degree  $n + 1$ . Moreover, we will show that modulus of  $f(x) - P_n(x)$  is less than or  $= M_{n+1} / (n + 1)!$  by  $n + 1$  factorial into modulus of  $P_{n+1}$  of  $x$ , where  $M_{n+1} = \text{maximum of modulus of } n + 1 \text{ derivative of } f \text{ for } x \text{ in the interval } a, b$ , this gives you the error bound on the interpolation error. We shall now provide details of the proof of this theorem.

(Refer Slide Time: 4:19)

Proof: Let  $x = x_i$

LHS:  $f(x_i) - p_n(x_i) = 0$

RHS:  $\frac{f^{(n+1)}(\xi)}{(n+1)!} (x_i - x_0)(x_i - x_1) \dots (x_i - x_n) \dots$

(\*) is identically satisfied.

Consider  $x \neq x_i, x \in [a, b]$

For such a value of  $x$ , define the function  $\phi(t)$  as follows:

$$\phi(t) = f(t) - p_n(t) - \left[ \frac{f(x) - p_n(x)}{\prod_{j=0}^n (x - x_j)} \right] \prod_{j=0}^n (t - x_j)$$

Note  $x$  is fixed.

$$\phi(x_i) = f(x_i) - p_n(x_i) - \left[ \frac{f(x) - p_n(x)}{\prod_{j=0}^n (x - x_j)} \right] \prod_{j=0}^n (x_i - x_j)$$

$$= 0 - [ ] 0 = 0, i = 0, 1, 2, \dots, n$$

Let us first take  $x$  to be say  $x_i$ , what are  $x_i$ ?  $x_i$  are the interpolation points, so what happens to the left hand side of star? Suppose I call this a star, then the left-hand side is such that I have  $f(x_i) + P_n$  of  $x_i$  and what is it, that is 0 because  $x_i$  have the interpolation points at which  $P_n$  of  $x$  interpolates the function  $f$ , so the left-hand side is 0. What happens to the right hand side, it is going to be  $n+1$  derivative of  $f$  by  $(n+1)!$  into  $P_{n+1}$  of  $x$ . What is  $P_{n+1}$  of  $x$ ? It is  $(x - x_0)(x - x_1) \dots (x - x_n)$  etc, and there will be a factor  $x_i - x_i$  into  $x_i - x_n$ . So because of this factor this is 0 so the right hand side is also 0, so star is identically satisfied at points  $x$  which are  $x_i$  namely the interpolation points, so star is identically satisfied when  $x$  is  $x_i$ .

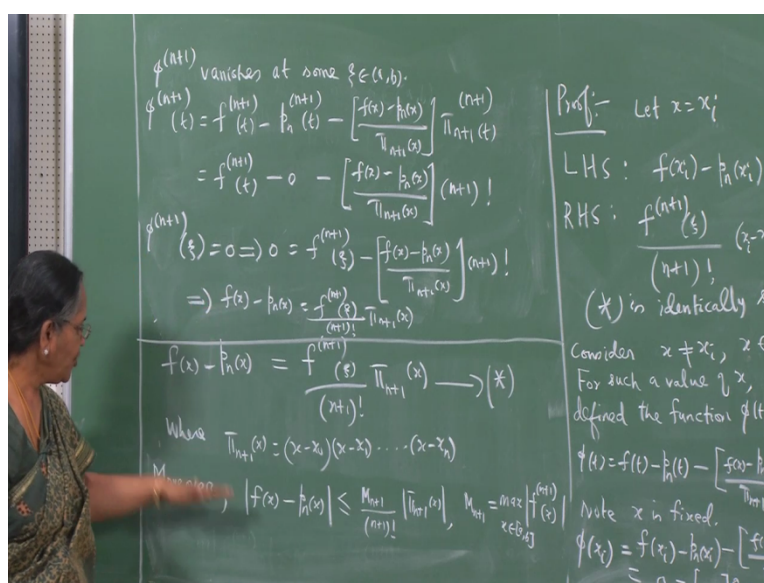

So we consider the case when  $x$  is different from  $x_i$  and  $x$  belongs to the interval  $a, b$ . So for such a value of  $x$ , we define the function  $\Phi$  of  $t$  as follows; namely  $\Phi$  of  $t$  is defined as  $f(t) + P_n$  of  $t + f(x) + P_n$  of  $x$  by  $P_{n+1}$  of  $x$  into  $P_{n+1}$  of  $t$ . Note that here  $x$  is fixed and  $x$  belongs to the interval  $a, b$ . Now I shall look into properties of  $\Phi$  of  $t$ ,  $\Phi$  at  $x_i$  where  $x_i$  are the interpolation points is such that it is  $f$  of  $x_i + P_n$  of  $x_i + f(x) + P_n$  of  $x$  divided by  $P_{n+1}$  of  $x$  into  $P_{n+1}$  at  $x_i$ . But what do I know about  $f$  of  $x_i + P_n$  of  $x_i$  that is a 0 + the terms within this bracket is a constant because  $x$  is fixed. What about  $P_{n+1}$  of  $x_i$ ?  $P_{n+1}$  of  $x_i$  contains the factor  $x_i - x_i$  in it and hence that is 0 and shows that  $\Phi$  of  $x_i$  is 0 for  $i = 0, 1, 2, 3, \dots, n$ , so there are  $n+1$  points  $x_i$  at which  $\Phi$  vanishes.

(Refer Slide Time: 8:27)

In addition let us see what is  $\Phi$  at  $x$  where  $x$  belongs to  $a, b$ ? So  $\Phi$  at  $x$  will be  $f$  of  $x + P^n$  of  $x + f$  of  $x + P^n$  of  $x$  by  $\Phi^{n+1}$  of  $x$  into  $\Phi^{n+1}$  of  $x$ , so we get  $f$  of  $x + P^n$  of  $x + f$  of  $x + P^n$  of  $x$  and so that is again 0. So we observe that  $\Phi$  vanishes at point  $x, x_0, x_1, x_2$ , etc, up to  $x_n$ , so there are  $n + 2$  points at which  $\Phi$  vanishes. So applying Rolle's Theorem we see that  $\Phi'$  vanishes at  $n + 1$  distinct points and each of these points' lies between the successive 0s of  $\Phi$ . I can continue to apply Rolle's Theorem again and that gives me that  $\Phi''$  vanishes at  $n$  distinct points, each of which lies between the successive 0s of  $\Phi'$ .

(Refer Slide Time: 10:45)

The assumptions about the function  $f$  in the theorem are sufficient, so that Rolle's Theorem can be applied in succession  $n + 1$  times and that shows that the  $n + 1$  derivative vanishes at some  $\xi$  in the interval  $a, b$ , so we compute the  $n + 1$  derivative of  $\Phi$ . So the  $n + 1$  derivative of  $\Phi$  will be the  $n + 1$  derivative of  $f$  + the  $n + 1$  derivative of  $P_n + f(x) + P_n$  of  $x$  by  $P_{n+1}$  of  $x$  into the  $n + 1$  derivative of  $P_{n+1}$  of  $x$ .

So this will be  $n + 1$  derivative of  $\Phi$ , what do you know about  $P_n$ ? It is a polynomial of degree at most  $n$ , so  $n + 1$  derivative is 0 so this term will give you  $f(x) + P_n$  of  $x$  by  $P_{n+1}$  of  $x$  into, let us find out what is the  $n + 1$  derivative of  $P_{n+1}$ . We know that  $P_{n+1}$  of  $x$  is a polynomial of degree  $n + 1$  and the leading term is  $x$  to the power of  $n + 1$ . So when you differentiate this  $n + 1$  times that will give you  $n + 1$  factorial.

But what do we know application of Rolle's Theorem in succession  $n + 1$  times gives that  $n + 1$  derivative of  $\Phi$  vanishes at some  $\xi$ . So the  $n + 1$  derivative of  $\xi$  is 0 and that gives you that  $n + 1$  derivative of  $f$  at  $\xi$  +  $f$  of  $x$  +  $P_n$  of  $x$  by  $P_{n+1}$  of  $x$  into  $n + 1$  factorial is 0. So if you rewrite this, we get  $f(x) + P_n$  of  $x$  to be  $n + 1$  derivative of  $f$  at  $\xi$  by  $n + 1$  factorial into  $P_{n+1}$  of  $x$  and this is what we are asked to show namely result star. So we have shown that the error in interpolation at any  $x$  in the interval  $a, b$  which is different from  $\xi$  is given by the right hand side, so we now have to prove this result.

(Refer Slide Time: 13:53)

The chalkboard contains the following content:

$$f(x) - p_n(x) = \frac{f^{(n+1)}(\xi)}{(n+1)!} \prod_{i=0}^n (x - x_i)$$

or  $f^{(n+1)}$  is continuous on the closed interval  $[a, b]$ ,  
the same is true for  $|f^{(n+1)}|$   
 $\therefore |f^{(n+1)}|$  is bounded on the closed interval  $[a, b]$   
 $|f^{(n+1)}| \leq M_{n+1}$   
and it achieves this maximum in  $[a, b]$ .

$$|f(x) - p_n(x)| \leq \frac{M_{n+1}}{(n+1)!} \left| \prod_{i=0}^n (x - x_i) \right|$$

I consider modulus of  $F(x) + P_n$  of  $x$ , so that will be modulus of  $f(x) + P_n$  of  $x$  so that will be modulus of  $n + 1$  derivative of  $\xi$  by  $n + 1$  factorial into modulus of  $P_{n+1}$  of  $x$ . As the  $n + 1$  derivative is continuous on the closed interval  $a, b$ , the same is true for absolute value of

the  $n + 1$  derivative of  $f$  on the interval  $a, b$ . And therefore modulus of the  $n + 1$  derivative of  $f$  is bounded on the closed interval  $a, b$ . So modulus of the  $n + 1$  derivative of  $f$  is less than or  $= M_{n+1}$  and it achieves this maximum on the interval  $a, b$  and so we have modulus of  $f(x) + P_n(x)$  is less than or  $= M_{n+1}$  by  $n + 1$  factorial into modulus of  $P_{n+1}(x)$  and that is what we have to prove and which is given here.

So we have been able to show the error in interpolation and also the, an estimate of the size of the bound on the error in interpolation namely this result. So with the help of this inequality we can provide an estimate on the size of error bound when we interpolate a given function  $f(x)$  by means of an interpolating polynomial of degree at most  $n$ . We will look into these details in the next class.
