**Review of Integral Transforms - III**

Hello friends. Welcome to my lecture on review of integral transforms III. This is third and final lecture on the review of integral transforms.

**(Refer Slide Time: 00:34)**

**The Fourier integral:** Fourier series are powerful tools in treating various problems involving periodic functions. But many practical problems do not involve periodic functions hence it is desirable to generalize the method of Fourier series to include non-periodic functions.

Let us consider two simple examples of periodic functions of period  $T$  and see what happens if we let  $T \rightarrow \infty$ .

**Example:** Consider the function

$$f_T(x) = \begin{cases} 0, & \text{when } -T/2 < x < -1 \\ 1, & \text{when } -1 < x < 1 \\ 0, & \text{when } 1 < x < T/2 \end{cases} \quad \text{having period } T > 2.$$

Let us look at the Fourier integral. We know that the Fourier series are powerful tools in treating various problems involving periodic functions but many practical problems do not involve periodic functions hence it is desirable to generalize the method of Fourier series to include non-periodic functions. Let us consider 2 simple examples of periodic functions of period  $T$  and see what happens if we let  $T$  tends to infinity.

Consider this function  $f_T(x) = 0$  when  $-T/2 < x < -1$ ,  $1$  when  $-1 < x < 1$ ,  $0$  when  $1 < x < T/2$  and the period of the function  $f_T(x)$  is  $T$  which is more than  $2$ .

**(Refer Slide Time: 01:22)**

When  $T \rightarrow \infty$ , we obtain a function  $f(x)$  which is not periodic.

$$f(x) = \lim_{T \rightarrow \infty} f_T(x) = \begin{cases} 1, & \text{when } -1 < x < 1 \\ 0, & \text{otherwise} \end{cases}$$

Then, we can look at the graph of  $f_T x$ . This is the graph of  $f_T x$ . You can see it is periodic function and here in the example we are taking  $T$  to be  $>2$  so let us consider  $T$  to be 4. So over the interval  $-2$  to  $2$  okay over the interval  $-2$  to  $2$  you will see that from  $-2$  to  $-1$   $f_T x$  is 0 then  $f_T x$  is 1 from  $-1$  to  $1$  then  $f_T x=0$  from  $1$  to  $2$  and it has been extended periodically over the whole real axis using the periodicity  $T=4$ .

Here we take another value of say  $T=8$  and then you see the graph of the function  $f_T x$  from  $-4$  to  $4$ . This is 0 from  $-4$  to  $-1$ ,  $-1$  to  $1$  it is 1 and then  $1$  to  $4$  it is 0 and then it has been extended periodically by using the period  $T=8$ . When  $T$  tends to infinity what happens, over the interval  $-1$  to  $1$  the graph is  $f_T=1$  okay as  $T$  tends to infinity while over the remaining values of  $x$  from  $x=1$  to infinity  $f_T x$  tends to 0,  $f x$  becomes 0 and then from  $-\infty$  to  $-1$  it is again 0.

And you can see that it is not periodic okay with any period so when  $T$  tends to infinity we obtain a function  $f x$  which is not periodic because  $f x$  becomes 1 when  $-1 < x < 1$  and 0 otherwise.

**(Refer Slide Time: 02:59)**

**Example:** Let  $f_T(x) = e^{-|x|}$ , for  $-\frac{T}{2} < x < \frac{T}{2}$   
 and  $f_T(x+T) = f_T(x)$ .

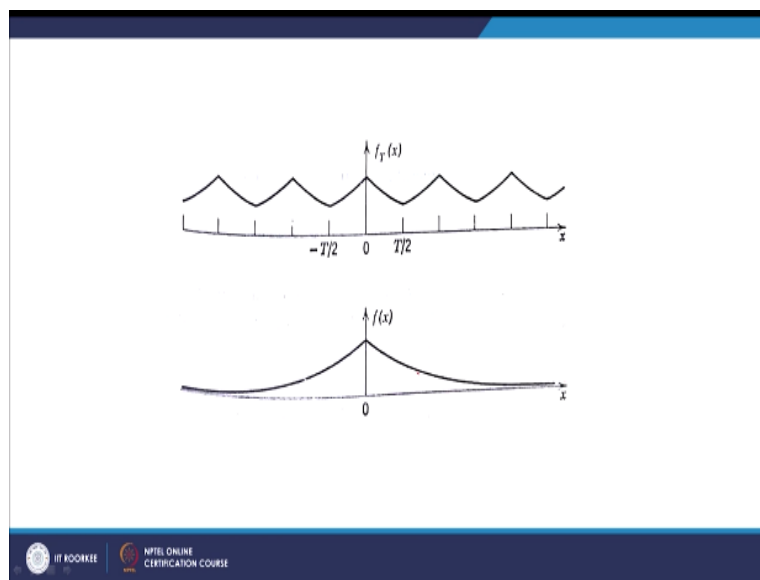

When  $T \rightarrow \infty$  we get the function  $f(x) = e^{-|x|}$  which is no longer periodic  
 $f(x) = \lim_{T \rightarrow \infty} f_T(x) = e^{-|x|}$ ,  $-\infty < x < \infty$ .

Now let us look at another example, let say  $f_T(x) = e^{-\text{mod of } x}$  for  $-\frac{T}{2} < x < \frac{T}{2}$  and  $f_T(x+T) = f_T(x)$ , so this equation tells us that  $f_T(x)$  has the period  $T$ , when  $T$  tends to infinity we get the function  $f(x) = e^{-|x|}$ ,  $f(x)$  is the limiting function of  $f_T(x)$  as  $T$  goes to infinity. As  $T$  goes to infinity, this interval turns to  $-\infty$  to  $\infty$  and  $f(x)$  becomes  $e^{-|x|}$ .

And you can see that it is no longer periodic,  $f(x) = e^{-|x|}$ . We have the graph of this function.

**(Refer Slide Time: 03:41)**

Here you see  $e^{-\text{mod of } x}$  okay,  $e^{-\text{mod of } x}$  is an even function from  $-\frac{T}{2}$  to  $\frac{T}{2}$ . So this is the graph of the function okay from  $-\frac{T}{2}$  to  $\frac{T}{2}$  and then it has been extended periodically by using the period  $T$ . Now here what happens when  $T$  tends to

infinity okay we have the graph of e to the power -mod of x like this, so you can see that it is not periodic anymore.

**(Refer Slide Time: 04:10)**

Let us consider any periodic function  $f_T(x)$  of period  $T$  which can be represented by the Fourier series

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos \omega_n x + b_n \sin \omega_n x), \quad \text{where } \omega_n = \frac{2n\pi}{T}.$$

If we let  $T \rightarrow \infty$  and assume that the resulting non-periodic function

$$f(x) = \lim_{T \rightarrow \infty} f_T(x)$$

is absolutely integrable i.e.  $\int_{-\infty}^{\infty} |f(x)| dx$  exists then we obtain

$$f(x) = \frac{1}{\pi} \int_0^{\infty} \{A(\omega) \cos \omega x + B(\omega) \sin \omega x\} d\omega \quad (1)$$

So we have to see what happens when  $f_T(x)$  tends to say function  $f(x)$  as  $T$  goes to infinity then what will be the representation of  $f(x)$ . So that is our problem. Let us consider any periodic function  $f_T(x)$  with period  $T$  then we can represent it by the Fourier series. Let us assume that  $x$  is a point of continuity of  $f$ , so  $f(x) = a_0/2 + \sum_{n=1}^{\infty} (a_n \cos \omega_n x + b_n \sin \omega_n x)$  and here  $\omega_n$  is  $2n\pi/T$ .

Now when we let  $T$  goes to infinity let us assume that  $f_T(x)$  tends to  $f(x)$ . We further assume that this limiting function  $f(x)$  is absolutely integrable that is the integral over  $-\infty$  to  $\infty$  of  $|f(x)| dx$  exists then this Fourier series while using the values of the Fourier coefficients  $a_0$ ,  $a_n$  and  $b_n$  in terms of the integrals okay and taking the limit what happens is that we get the effects as this integral,  $1/\pi \int_0^{\infty} \{A(\omega) \cos \omega x + B(\omega) \sin \omega x\} d\omega$  where  $A(\omega)$  and  $B(\omega)$  are given by these integrals.

**(Refer Slide Time: 05:22)**

where, 
$$A(\omega) = \int_{-\infty}^{\infty} f(v) \cos \omega v \, dv \quad \text{and}$$

$$B(\omega) = \int_{-\infty}^{\infty} f(v) \sin \omega v \, dv$$

The integral on right hand side of (1) is called as **the Fourier integral**.

The sufficient condition for the validity of (1) are given in the following result:

**Theorem:** If  $f(x)$  is piecewise continuous in every finite interval and has a left and right hand derivatives at every point and  $f$  is absolutely integrable, then  $f(x)$  can be represented by a Fourier integral. At a point of discontinuity, the value of the Fourier integral is equal to the average of the left and right hand limits at that point.

A  $\omega$  is  $-\infty$  to  $\infty$   $f v \cos \omega v \, dv$  and  $B \omega$  is integral over  $-\infty$  to  $\infty$   $f v \sin \omega v \, dv$ . The integral on the right hand side of (1) this integral okay. The integral on the right hand side of (1) is called the Fourier integral of  $f$ . The sufficient conditions for the validity of this representation of effects by the Fourier integral are given in the following theorem.

So if  $f(x)$  is piecewise continuous in every finite interval of the real axis and left and right hand derivatives exist at every point and  $f$  is absolutely integrable that is  $\int_{-\infty}^{\infty} |f(x)| \, dx < \infty$  then  $f(x)$  can be represented by a Fourier integral. So at a point of discontinuity the value of the Fourier integral = to the average of the left hand and right hand limits.

And that point like we have seen in the case of Fourier series representation of a function  $f$  at the point of discontinuity the sum of the Fourier series is average of the left hand and right hand limits, so here also at a point of discontinuity the value of the Fourier integral is equal to the average of left and right hand limits. At each point of continuity, the Fourier integral =  $f(x)$ .

**(Refer Slide Time: 06:46)**

**Note:** If  $f$  is an even function in  $(-\infty, \infty)$  then  $B(\omega) = 0$ , hence

$$f(x) = \frac{1}{\pi} \int_0^{\infty} A(\omega) \cos \omega x d\omega, \quad (2)$$

$$\text{where } A(\omega) = 2 \int_0^{\infty} f(v) \cos \omega v dv$$

while if  $f$  is an odd function,  $A(\omega) = 0$ , hence

$$f(x) = \frac{1}{\pi} \int_0^{\infty} B(\omega) \sin \omega x d\omega, \quad (3)$$

$$\text{where } B(\omega) = 2 \int_0^{\infty} f(v) \sin \omega v dv.$$

So now notice that if  $f$  is an even function in the interval  $-\infty$  to  $\infty$  then the value of  $B(\omega)$ ,  $B(\omega)$  is given by this integral, so if  $f$  is an even function okay then  $f$  is an even function and  $\sin \omega x$  is an odd function so the product will be an odd function and therefore  $B(\omega)$  will be  $= 0$  and when  $B(\omega) = 0$  the cosine terms will remain while sine terms will vanish.

And the  $A(\omega)$  will become  $2 \int_0^{\infty} f(v) \cos \omega v dv$  because  $\cos \omega v$  is an even function so  $f(v) \cdot \cos \omega v$  will be even. So we will have  $A(\omega) = 2 \int_0^{\infty} f(v) \cos \omega v dv$  so here when  $f$  is an even function the Fourier integral representation of  $f$  contains only this cosine terms, sine term is not present in the Fourier integral representation.

Similarly, if we have  $f$  to be an odd function then  $A(\omega) = 0$  because  $f$  is odd  $\cos \omega v$  is even so the product is odd and  $B(\omega)$  becomes  $2 \int_0^{\infty} f(v) \sin \omega v dv$ . So here then in the Fourier integral representation of  $f$  only sine terms remain, the cosine terms vanish, so  $B(\omega)$  becomes this and the Fourier integral representation is containing only sine term here.

**(Refer Slide Time: 08:17)**

The integrals in (2) and (3) are called Fourier cosine and sine integrals respectively.

**Remark:** Just as in the case of half range Fourier series, a function  $f(x)$  defined over the interval  $(0, \infty)$  may be expressed as a Fourier sine or cosine integral. Further, we observe that the representation of a non-periodic function  $f(x)$  given by (1) is similar to the representation of a function by a Fourier series except that the range is now  $(-\infty, \infty)$  and the summation has been replaced by integration.

o

The integrals 2 and 3, these 2 integrals, integral this 2 and integral 3 are called this integral 3 and this integral 2 they are called as Fourier cosine and Fourier sine integrals. This one is called Fourier cosine integral,  $f(x)$  this is called Fourier sine integral,  $f(x)$  this is called Fourier sine integral of  $f$ . Now just as in the case of half range Fourier series if a function  $f$  is defined over the half range say  $0$  to  $\infty$  then over the interval  $-\infty$  to  $0$  we can define it by using the even extension or the odd extension.

And then we can find the Fourier integral representation of the function  $f(x)$  like in the case of Fourier series. So here we notice that the representation of a non-periodic function  $f(x)$  given by this equation 1 is similar to the Fourier series representation of the periodic function  $f(x)$ . Here also you can see we have  $A \cos \omega x$ ,  $B \sin \omega x$  like in the case of Fourier series but there we have summation here we have integration that is the difference.

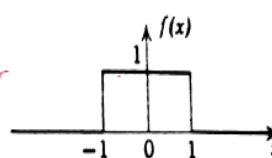

So range is now  $-\infty$  to  $\infty$  and the summation has been replaced by integration.

**(Refer Slide Time: 09:38)**

**Example:** Find the Fourier integral representation of the function

$$f(x) = \begin{cases} 1, & \text{when } |x| < 1 \\ 0, & \text{when } |x| > 1 \end{cases}$$

$\int_{-\infty}^{\infty} |f(x)| dx = \int_{-1}^1 1 dx = 2 < \infty$   
 $f(x) = \frac{1}{\pi} \int_0^{\infty} [A(\omega) \cos \omega x + B(\omega) \sin \omega x] d\omega$   
 $A(\omega) = \frac{2}{\pi} \int_0^{\infty} f(v) \cos \omega v dv = \frac{2}{\pi} \int_0^1 1 \cos \omega v dv = \frac{2}{\pi} \left( \frac{\sin \omega v}{\omega} \right)_0^1 = \frac{2 \sin \omega}{\pi \omega}$   
 $B(\omega) = \frac{2}{\pi} \int_0^{\infty} f(v) \sin \omega v dv = 0$   
 $\therefore f(x) = \frac{2}{\pi} \int_0^{\infty} \frac{\sin \omega}{\omega} \cos \omega x d\omega$

At  $x = \pm 1$  points of discontinuity  
 $\frac{2}{\pi} \int_0^1 \frac{\sin \omega}{\omega} \cos \omega d\omega = \frac{1}{2}$  or  $\int_0^{\infty} \frac{\sin \omega \cos \omega}{\omega} d\omega = \frac{\pi}{4}$

III KOORKEE NPTEL ONLINE CERTIFICATION COURSE 10

Let us find the Fourier integral representation of the function  $f(x) = 1$  when  $|x| < 1$ ,  $0$  when  $|x| > 1$ . You can see that  $f$  is piecewise continuous on every finite interval and moreover that  $\int_{-\infty}^{\infty} |f(x)| dx = \int_{-1}^1 1 dx = 2 < \infty$ . You can see this function is an even function okay,  $f$  is an even function and first we reduce the interval  $-\infty$  to  $\infty$  to  $-1$  to  $1$  because everywhere else it is  $0$ .

So  $\int_{-\infty}^{\infty} |f(x)| dx$  and  $\int_{-\infty}^{\infty} f(x) dx$  takes value  $2$  when  $|x| < 1$  so we get here  $-1$  to  $1$   $dx$  this  $= 2$  and which is  $< \infty$ . So  $f$  is absolutely integrable, furthermore  $f$  is having left and right hand derivatives at each point of the real axis okay. Now let us recall the definition of the Fourier integral. Fourier integral  $f(x)$  at each point of continuity let  $x$  be a continuity point so  $f(x) = \frac{1}{\pi} \int_0^{\infty} \int_{-\infty}^{\infty} f(v) \cos \omega v dv d\omega$ .

Let  $x$  be a continuity point of  $f$ , so then the Fourier integral becomes  $f(x) = \frac{1}{\pi} \int_0^{\infty} [A(\omega) \cos \omega x + B(\omega) \sin \omega x] d\omega$ . Now here we see that  $B(\omega) = 0$ ,  $f$  is an even function okay so  $B(\omega) = 0$  to  $\infty$   $f(v) \sin \omega v dv$  okay. Since  $f$  is an even function  $\sin \omega v$   $B$  is an odd function so the product of even and odd is odd and therefore this is  $-\infty$  to  $\infty$  so this is  $= 0$  and  $A(\omega)$  becomes  $2$  times  $\int_0^{\infty} f(v) \cos \omega v dv$  okay.

So we get this  $2$  times  $f(v) \cos \omega v dv$  and let us use the value of  $f$ ,  $f=1$  over the interval  $0, 1$  and elsewhere from  $1$  to  $\infty$  to  $0$  so this is  $2$  times  $\int_0^1 1 \cos \omega v dv$  and we get it as  $2$  times  $\frac{\sin \omega v}{\omega}$  okay  $0$  to  $1$  because it is  $1$ , over the interval  $0, 1$  it is  $1$ , so with this  $2$  times  $\frac{\sin \omega}{\omega}$  okay. So thus  $f(x) = \frac{2}{\pi} \int_0^{\infty} \frac{\sin \omega}{\omega} \cos \omega x d\omega$  is  $2$  times  $\frac{\sin \omega}{\omega}$ .

So this is  $\frac{\sin \omega}{\omega} \cos \omega x$ , we have written outside  $\int_0^\infty \frac{\sin \omega \cos \omega x}{\omega} d\omega$ . This is the Fourier integral representation of  $f$  at each point of continuity of  $f$  and if you look at the interval  $-1$  to  $1$  it is discontinuous at  $-1$  it is discontinuous at  $0$ , it is discontinuous at  $1$ . So the points of discontinuity are  $x = \pm 1$  not  $0$ . At  $x=0$  it is continuous so these are points of discontinuity.

So from the points of discontinuity the sum of the Fourier series is to the average of left hand and right hand limits. Now at the point  $-1$  left hand limit is  $0$ , right hand limit is  $1$ , so average is  $0+1/2$  that is  $1/2$  and at  $1$  the left hand limit is  $1$ , right hand limit is  $0$  so again average is  $1/2$  so we have  $\frac{2}{\pi} \int_0^\infty \frac{\sin \omega \cos \omega x}{\omega} d\omega$  and when  $x=1$   $\cos \omega x$  is  $\cos \omega$  when  $x$  is  $-1$  again  $\cos \omega x$  is  $\cos \omega$ .

So at  $x=0$   $\int_0^\infty \frac{\sin \omega \cos \omega x}{\omega} d\omega = f(x) = 1/2$ . So we can say that integral or you can say  $\int_0^\infty \frac{\sin \omega \cos \omega x}{\omega} d\omega = \frac{\pi}{4}$ .

**(Refer Slide Time: 14:57)**

Thus,

$$\int_0^\infty \frac{\sin \omega \cos \omega x}{\omega} d\omega = \begin{cases} \frac{\pi}{2}, & \text{when } |x| < 1 \\ \frac{\pi}{4}, & \text{when } x = \pm 1 \\ 0, & \text{when } |x| > 1 \end{cases}$$

In particular, when  $x = 0$ , we obtain

$$\int_0^\infty \frac{\sin \omega}{\omega} d\omega = \frac{\pi}{2}.$$

Thus, Fourier integrals may also be used for evaluating improper integrals.

NPTEL ONLINE CERTIFICATION COURSE 11

So let us see the integral  $\int_0^\infty \frac{\sin \omega \cos \omega x}{\omega} d\omega$  this is  $\frac{\pi}{2}$  when  $\text{mod of } x < 1$  because when  $\text{mod of } x < 1$   $f(x)$  becomes  $1$  so  $\int_0^\infty \frac{\sin \omega \cos \omega x}{\omega} d\omega$  is  $\frac{\pi}{2}$ . At  $x = \pm 1$ , the value is  $\frac{\pi}{4}$  and when  $\text{mod of } x > 1$  this  $f(x) = 0$  so  $\int_0^\infty \frac{\sin \omega \cos \omega x}{\omega} d\omega$  is  $0$ . In particular, when we take  $x=0$  you take  $x=0$  then at  $x=0$   $f(x)$  takes value  $1$  and it is a point of continuity.

**(Refer Slide Time: 15:48)**

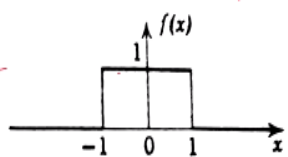

**Example:** Find the Fourier integral representation of the function

$$f(x) = \begin{cases} 1, & \text{when } |x| < 1 \\ 0, & \text{when } |x| > 1 \end{cases}$$

$\int_{-\infty}^{\infty} |f(x)| dx = \int_{-1}^1 1 dx = 2 < \infty$   
 $f(x) = \frac{1}{\pi} \int_0^{\infty} (A(\omega) \cos \omega x + B(\omega) \sin \omega x) d\omega$   
 $A(\omega) = \frac{2}{\pi} \int_0^{\infty} f(v) \cos \omega v dv = \frac{2}{\pi} \int_0^1 \cos \omega v dv = \frac{2}{\pi} \left( \frac{\sin \omega v}{\omega} \right)_0^1 = \frac{2 \sin \omega}{\pi \omega}$   
 $B(\omega) = \frac{2}{\pi} \int_0^{\infty} f(v) \sin \omega v dv = 0$   
 $\therefore f(x) = \frac{2}{\pi} \int_0^{\infty} \frac{\sin \omega}{\omega} \cos \omega x d\omega$

At  $x=0$   
 $1 = \frac{2}{\pi} \int_0^{\infty} \frac{\sin \omega}{\omega} d\omega$   
 $\Rightarrow \int_0^{\infty} \frac{\sin \omega}{\omega} d\omega = \frac{\pi}{2}$

At  $x = \pm 1$  Points of discontinuity  
 $\frac{2}{\pi} \int_0^{\infty} \frac{\sin \omega}{\omega} \cos \omega d\omega = \frac{1}{2}$  or  $\int_0^{\infty} \frac{\sin \omega \cos \omega}{\omega} d\omega = \frac{\pi}{4}$

So  $1 = \frac{2}{\pi} \int_0^{\infty} \frac{\sin \omega}{\omega} \cos \omega x d\omega$  at  $x=0$ . It is a point of continuity and this gives you  $\int_0^{\infty} \frac{\sin \omega}{\omega} d\omega = \frac{\pi}{2}$  okay. So you can see we can find even some improper integrals while using the Fourier integral representation of a function  $f$ .

**(Refer Slide Time: 16:23)**

Thus,

$$\int_0^{\infty} \frac{\sin \omega \cos \omega x}{\omega} d\omega = \begin{cases} \frac{\pi}{2}, & \text{when } |x| < 1 \\ \frac{\pi}{4}, & \text{when } x = \pm 1 \\ 0, & \text{when } |x| > 1 \end{cases}$$

In particular, when  $x = 0$ , we obtain

$$\int_0^{\infty} \frac{\sin \omega}{\omega} d\omega = \frac{\pi}{2}.$$

Thus, Fourier integrals may also be used for evaluating improper integrals.

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 11

Now let us discuss the inversion formulae for Fourier transforms. We may write equation 1 as let us put the values of  $A(\omega)$  and  $B(\omega)$  in this Fourier integral representation. Then, we will have  $f(x) = \frac{1}{\pi} \int_{-\infty}^{\infty} A(\omega) \cos \omega x + B(\omega) \sin \omega x d\omega$  so we will have  $f(x) = \frac{1}{\pi} \int_{-\infty}^{\infty} f(v) \cos \omega v \cos \omega x + f(v) \sin \omega v \sin \omega x d\omega$ .

**(Refer Slide Time: 17:02)**

**Inversion formulae for Fourier transforms:** We may write (1) as

$$f(x) = \frac{1}{\pi} \int_0^{\infty} \left[ \int_{-\infty}^{\infty} f(v) \cos \omega(x-v) dv \right] d\omega, \quad (4)$$

by substituting the values of  $A(\omega)$  and  $B(\omega)$ .

Since  $\cos \omega(x-v)$  is an even function of  $\omega$ , (4) may be written as

$$f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \left[ \int_{-\infty}^{\infty} f(v) \cos \omega(x-v) dv \right] d\omega, \quad (5)$$

So using  $\cos A, \cos B + \sin A \sin B = \cos A - B$  we have this expression  $1/\pi$  integral over 0 to infinity, -infinity to infinity  $f v \cos \omega x - v dv d \omega$  now by substituting the values of  $A \omega$  and  $B \omega$ . Now here better let us look at this function  $\cos \omega x - v$  it is an even function of  $\omega$ , the integral over  $\omega$  is from 0 to infinity, so we can make it from -infinity to infinity and divide by 2 because of the fact that  $\cos \omega x - v$  is an even function.

So this becomes  $1/2 \pi$ -infinity to infinity, -infinity to infinity  $f v \cos \omega x - v dv d \omega$ .

**(Refer Slide Time: 17:42)**

Since  $\sin \omega(x-v)$  is an odd function of  $\omega$ , we have

$$0 = \frac{i}{2\pi} \int_{-\infty}^{\infty} \left[ \int_{-\infty}^{\infty} f(v) \sin \omega(x-v) dv \right] d\omega. \quad (6)$$

Adding (5) and (6), we have

$$f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \left[ \int_{-\infty}^{\infty} f(v) e^{i\omega(x-v)} dv \right] d\omega. \quad (7)$$

This is known as complex form of the Fourier integral.

Now let us look at the fact that  $\sin \omega x - v$  is an odd function of  $\omega$ , so if you calculate this integral, integral over -infinity to infinity, -infinity to infinity  $f v \sin \omega x - v dv d \omega$ . Then, because this is an odd function integral over -infinity to infinity with respect to

omega will be 0 so the whole thing will become 0. This is iota so  $0 = i\omega/2\pi$  and then this expression we have.

Now we add the equation 5 with equation 6 okay, this equation 5 and the equation 6 and use the formula  $e^{i\theta} = \cos \theta + i \sin \theta$ . When we use this formula  $f(x)$  becomes  $\frac{1}{2\pi} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(v) e^{i\omega x - i\omega v} dv d\omega$  instead of  $\theta$  here we have  $\omega x - v$ . So this is known as complex form of the Fourier integral

Now we may write this equation in the following manner  $e^{i\omega x} e^{-i\omega v}$ . Let us split into 2 parts,  $e^{i\omega x}$  to the power  $-i\omega v$ . The inside integral is with respect to  $v$ , so  $e^{-i\omega v}$  will be kept inside,  $e^{i\omega x}$  contains  $\omega$  so this  $v$  we can take outside the integral with respect to  $v$ .

**(Refer Slide Time: 19:20)**

We may write (7) as

$$f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{i\omega x} \left[ \int_{-\infty}^{\infty} f(v) e^{-i\omega v} dv \right] d\omega = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} F(\omega) e^{i\omega x} d\omega, \quad (8)$$

where

$$F(\omega) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(v) e^{-i\omega v} dv. \quad (9)$$

The function  $F(\omega)$  given by (9) is called the Fourier transform of the function  $f(x)$ . Also, the function  $f(x)$ , given by (8) is known as inverse Fourier transform of  $F(\omega)$ .

And then what we have  $\frac{1}{2\pi} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(v) e^{i\omega x - i\omega v} dv d\omega$ . Now this can be written as  $\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} F(\omega) e^{i\omega x} d\omega$  where  $F(\omega)$  is defined as  $\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(v) e^{-i\omega v} dv$ . This is split into 2 parts,  $\frac{1}{\sqrt{2\pi}}$  comes with  $F(\omega)$  and the other  $\frac{1}{\sqrt{2\pi}}$  goes with the remaining integrals, so  $F(\omega) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(v) e^{-i\omega v} dv$ .

Now this representation okay is called as the Fourier transform of the function  $F$ . So the  $F(\omega)$  is called the Fourier transform of the function  $F$  and the function  $f(x)$  given by  $\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} F(\omega) e^{i\omega x} d\omega$

$\pi$ -infinity to infinity  $F(\omega) e^{i\omega x} d\omega$  is termed as the inverse Fourier transform of  $F(\omega)$ . Now some authors will take here  $1/\sqrt{2\pi}$  instead of  $1/2\pi$  and there we will take  $1/2\pi$  while we use the inversion formula for Fourier transform.

So there is no ambiguity in that because where we generally use these Fourier transforms in the practical problem that is the heat conduction problems or other problems, so there first we apply the Fourier transform okay and then we apply the inversion formula for the Fourier transform. So if we multiply here by 1 and here we take  $1/2\pi$  it is the same thing because if you take  $1/\sqrt{2\pi}$  in  $F(\omega)$  and then while inverting you take  $1/\sqrt{2\pi}$  then also the result is the same.

**(Refer Slide Time: 21:10)**

In a similar fashion, we obtain from equations (2) and (3)

where

$$f(x) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} F_c(\omega) \cos \omega x d\omega, \quad (10)$$

$$F_c(\omega) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} f(v) \cos \omega v dv, \quad (11)$$

and

$$f(x) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} F_s(\omega) \sin \omega x d\omega, \quad (12)$$

where

$$F_s(\omega) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} f(v) \sin \omega v dv, \quad (13)$$

Handwritten notes in red ink on the slide include:  
 - For (10):  $f(x) = \frac{2}{\pi} \int_0^{\infty} f(v) \cos \omega v \cos \omega x d\omega$   
 - For (11):  $f(x) = \frac{2}{\pi} \int_0^{\infty} f(v) \cos \omega v \cos \omega x d\omega$   
 - For (12):  $f(x) = \frac{2}{\pi} \int_0^{\infty} f(v) \sin \omega v \sin \omega x d\omega$   
 - For (13):  $F_s(\omega) = \frac{2}{\pi} \int_0^{\infty} f(v) \sin \omega v dv$

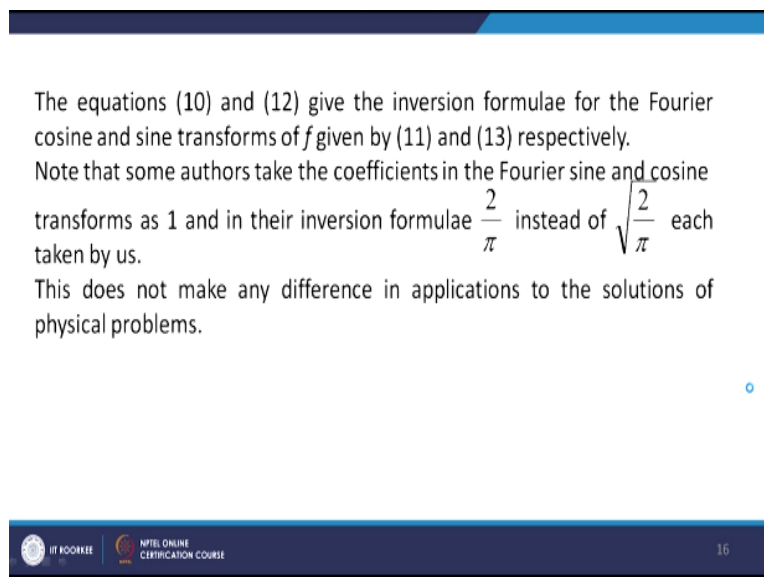

In a similar manner, we can obtain from equations 2 and 3 let us look at equation 2 and 3, yes from here okay so this is  $f(x) = 1/\pi \int_0^{\infty} A(\omega) \cos \omega x$  okay so we will get it as into 2 parts let us take it okay so if you put the values there okay in equation 2 and 3 yes so in equation 2 and 3 we have Fourier cosine, Fourier sine transforms okay we have  $f(x) = 2/\pi$ . See we get the Fourier cosine integral and Fourier sine integral by assuming  $F$  to be even and odd okay.

So from that representation okay  $f(x)$  becomes Fourier cosine integral  $2/\pi \int_0^{\infty}$ ,  $0$  to infinity  $f(v) \cos \omega v dv d\omega$ . This is Fourier cosine integral okay, so you can break it into 2 parts,  $\sqrt{2/\pi} \int_0^{\infty}$  and then  $\sqrt{2/\pi} \int_0^{\infty} f(v) \cos \omega v dv d\omega$  okay so what we do is and then  $\cos \omega v$  and then  $\cos \omega x$  also. So  $\cos \omega x$  will be written here okay.

And what we will get  $\sqrt{2/\pi} \int_0^{\infty} f(v) \cos \omega v \, dv$ , this quantity is termed as  $F_c \omega$ , so we will get  $\sqrt{2/\pi} \int_0^{\infty} F_c \omega \cos \omega x \, d\omega$  okay. So this  $F_c \omega$  is called as the Fourier cosine transform. This  $c$  denotes cosine transform okay, Fourier cosine transform of  $f(x)$  okay and this  $f(x) = \sqrt{2/\pi} \int_0^{\infty} F_c \omega \cos \omega x \, d\omega$  is called as the inversion formula for the Fourier cosine transform.

Similarly, for Fourier sine integral okay Fourier sine integral we have  $f(x) = \sqrt{2/\pi} \int_0^{\infty} f(v) \cos \omega x \sin \omega v \, d\omega$  and in the similar manner I can write it as  $\sqrt{2/\pi} \int_0^{\infty} F_s \omega \sin \omega x \, d\omega$  where  $F_s \omega$  is given by  $\sqrt{2/\pi} \int_0^{\infty} f(v) \sin \omega v \, dv$ ,  $F_s \omega$  means Fourier sine transform. So these are the Fourier sine transform and this is inversion formula for Fourier sine transform.

**(Refer Slide Time: 24:56)**

Now these equations give the inversion formulae for the Fourier cosine and Fourier sine transform of  $f$ . Some authors as I said in the case of Fourier transforms here also some authors take here is 1 and here  $2/\pi$ , here 1, here  $2/\pi$ . I have taken  $\sqrt{2/\pi}$ , I have split  $2/\pi$  into 2 parts,  $\sqrt{2/\pi}$ ,  $\sqrt{2/\pi}$  but there is no ambiguity if you take 1 here and  $2/\pi$  there.

**(Refer Slide Time: 25:23)**

**Example:** Solve the integral equation

$$\int_0^{\infty} f(x) \cos \omega x \, dx = e^{-\omega}.$$

So let us solve this equation  $\int_0^{\infty} f(x) \cos \omega x \, dx$ . This is an integral equation because the unknown function  $f(x)$  appears under the integral sign. Now let us note that this is nothing but the Fourier cosine transform of the function  $f$ . Let us look at this Fourier cosine transform, this is  $F_c(\omega) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} f(v) \cos \omega v \, dv$ . So let us take instead of  $\sqrt{\frac{2}{\pi}}$  let us take 1 here then  $F_c(\omega)$  is  $\int_0^{\infty} f(v) \cos \omega v \, dv$ .

Let us solve this integral equation, this is an integral equation because the unknown function  $f(x)$  appears under the integral sign. If you look at the integral, it is  $\int_0^{\infty} f(x) \cos \omega x \, dx$  so it actually gives the Fourier cosine transform of the function  $f$ . If you look at this expression  $F_c(\omega) = \sqrt{\frac{2}{\pi}} \int_0^{\infty} f(v) \cos \omega v \, dv$ . So if you replace this variable of integration  $v/x$ , it is  $\int_0^{\infty} f(x) \cos \omega x \, dx$ .

So what we do is let us take the coefficient here  $\sqrt{\frac{2}{\pi}}$  as 1 then take  $f(x)$  expression for  $f(x)$  we will take instead of  $\sqrt{\frac{2}{\pi}}$   $\frac{2}{\pi}$ .

**(Refer Slide Time: 26:42)**

**Example:** Solve the integral equation

$$\int_0^{\infty} f(x) \cos \omega x \, dx = e^{-\omega}$$

$F_c(\omega) = \int_0^{\infty} f(x) \cos \omega x \, dx = e^{-\omega}$ 
 $I\left(\frac{1}{x^2}\right) = \frac{1}{x^2} \Rightarrow I = \frac{1}{1+x^2}$

$f(x) = \frac{2}{\pi} \int_0^{\infty} F_c(\omega) \cos \omega x \, d\omega$   
 $= \frac{2}{\pi} \int_0^{\infty} e^{-\omega} \cos \omega x \, d\omega$

$I = \int_0^{\infty} e^{-\omega} \cos \omega x \, d\omega = \left( \frac{e^{-\omega} \sin \omega x}{-x} \right)_0^{\infty} - \int_0^{\infty} (-e^{-\omega}) \frac{\sin \omega x}{x} d\omega$   
 $= 0 + \frac{1}{x} \int_0^{\infty} e^{-\omega} \sin \omega x \, d\omega = \frac{1}{x} \left[ \left\{ \frac{e^{-\omega} (-\cos \omega x)}{x} \right\}_0^{\infty} - \int_0^{\infty} (-e^{-\omega}) \left( -\frac{\cos \omega x}{x} \right) d\omega \right]$   
 $f(x) = \frac{2}{\pi(1+x^2)}$ 
 $= \frac{1}{x} \left[ \frac{1}{x} - \frac{1}{x} \int_0^{\infty} e^{-\omega} \cos \omega x \, d\omega \right]$   
 $= \frac{1}{x^2} (1 - I)$

17

So let us say that  $F_c(\omega)$  let us take the definition of  $F_c(\omega)$  at 0 to infinity  $f(x) \cos \omega x \, dx$  okay. So if you compare with this it is  $e^{-\omega}$ . Now let us find the inverse formula so  $\frac{2}{\pi} \int_0^{\infty} F_c(\omega) \cos \omega x \, d\omega$  okay. So this is  $\frac{2}{\pi} \int_0^{\infty} e^{-\omega} \cos \omega x \, d\omega$ . Let us take  $I = \int_0^{\infty} e^{-\omega} \cos \omega x \, d\omega$ .

Then, I can write this we can integrate by parts so  $e^{-\omega} \sin \omega x / x$  0 to infinity  $-0$  to infinity  $-e^{-\omega}$  and  $\sin \omega x / x$  okay. So when  $\omega$  goes to infinity  $e^{-\omega}$  goes to 0 while  $\sin \omega x$  is a bounded function and therefore product goes to 0 and when  $\omega$  is 0  $\sin \omega x$  is 0 so the first expression becomes 0, this -- becomes + and when we write  $1/x$  outside what we have 0 to infinity  $e^{-\omega} \sin \omega x \, d\omega$ .

So again we integrate by parts, so  $e^{-\omega} \int \sin \omega x \, dx = -\cos \omega x / x$  0 to infinity  $-0$  to infinity  $-e^{-\omega} \cos \omega x / x$  okay. Now when  $\omega$  goes to infinity  $e^{-\omega}$  goes to 0  $\cos \omega x$  axis bounded by 1 so the product goes to 0 and when we put the lower limit what we have  $e^{-\omega}$  when we put  $\omega$  is 0 this is 1 and this is  $-1/x$  so we get  $+1/x$ .

Then, this becomes ---so we get  $-1/x \int_0^{\infty} e^{-\omega} \cos \omega x \, d\omega$ . So this is  $1/x^2 (1 - I)$  okay. We have denoted 0 to infinity  $e^{-\omega} \cos \omega x \, d\omega$  is  $I$  so  $1/x^2 (1 - I)$  we have okay. So what we have, let us

take this term to the other side then I times  $1+1/x$  square we have  $=1/x$  square. So this gives us  $I=1/1+s$  square okay.

So what we have here  $f(x)=2/\pi \cdot 1+x$  square, so we can solve the integral equation by using Fourier cosine transform.

**(Refer Slide Time: 30:37)**

Then

$$f(x) = \frac{2}{\pi(1+x^2)}$$

18

So  $f(x)$  is  $2/\pi \cdot 1+x$  square.

**(Refer Slide Time: 30:39)**

Integral transforms are used to find the solution of a partial differential equation. The choice of particular transform to be used for the solution of the differential equation depends upon the nature of the boundary conditions of the equation and the facility with which the transform  $F(\omega)$  can be inverted to give  $f(x)$ .

Let  $u(x, t)$  and  $\frac{\partial u}{\partial x}$  be functions which tend to zero as  $x \rightarrow \pm\infty$ . Then

Fourier transform of  $\frac{\partial^2 u}{\partial x^2}$  is given by

$$F\left(\frac{\partial^2 u}{\partial x^2}\right) = -\omega^2 U(\omega, t), \text{ where } U(\omega, t) = F(u(x, t)).$$

Handwritten notes on slide 19 include:  
 $= -\omega^2 F(u(x, t))$   
 $= -\omega^2 U(\omega, t)$   
 $|e^{-i\omega x}| = 1$   
 $F(u(x, t)) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \frac{\partial^2 u}{\partial x^2} e^{i\omega x} dx$   
 $= \frac{1}{\sqrt{2\pi}} \left[ \left( \frac{\partial u}{\partial x} e^{i\omega x} \right)_{-\infty}^{\infty} - \int_{-\infty}^{\infty} \frac{\partial u}{\partial x} (-i\omega e^{i\omega x}) dx \right]$   
 $= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \frac{\partial u}{\partial x} e^{i\omega x} dx$   
 $= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} u e^{i\omega x} dx$   
 $= \frac{1}{\sqrt{2\pi}} [u e^{i\omega x}]_{-\infty}^{\infty} - \int_{-\infty}^{\infty} u (-i\omega e^{i\omega x}) dx$

19

Now integral transforms are used to find the solution of a partial differential equation. The choice of a particular transform to be used for the solution of the differential equation depends upon the nature of the boundary conditions of the required problem and the facility with which the transform  $F(\omega)$  can be inverted to give  $f(x)$ .

Let us assume that in the problems that we consider the  $u(x, t)$  function, function which depends on the space variable  $x$  and time  $t$  and its derivative with respect to  $x$  that is gradient be functions which tend to 0 as  $x$  goes to  $+\infty$  then the Fourier transform of  $u_{xx}$  is given by this. So let us see how this Fourier transform we are getting. Let us go to the definition of the Fourier transform.

Fourier transform be defined as  $\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(v) e^{-i\omega v} dv$ . So let us use this definition okay. So  $F$  of  $u_{xx}$ ,  $x$  so let me redo here so Fourier transform of  $u_{xx} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-i\omega x} dx$  okay. So when we integrate by parts what we get integral of this second order derivative becomes first order derivative  $\cdot e^{-i\omega x}$  from  $-\infty$  to  $+\infty$  then  $-\int_{-\infty}^{\infty} u(x) \cdot (-i\omega) e^{-i\omega x} dx$ .

Now let us see we have assumed that this  $u_x$  we have assumed that  $u_x$  goes to 0 when  $x$  goes to  $+\infty$  and let us remember that  $e^{-i\omega x}$ . Modulus of this is 1, so it is a bounded quantity so when  $u_x$  goes to 0 when  $x$  goes to  $+\infty$  and  $u_x$  goes to 0 when  $x$  goes to  $-\infty$  because of the boundedness of  $e^{-i\omega x}$ , this part becomes 0 and what we get is then  $\frac{1}{\sqrt{2\pi}} i\omega \int_{-\infty}^{\infty} u(x) e^{-i\omega x} dx$ .

Let us integrate once more, so  $\frac{1}{\sqrt{2\pi}} i\omega$  when we integrate once more we get  $u \cdot e^{-i\omega x}$  to the power  $-i\omega x$  from  $-\infty$  to  $+\infty$  and then  $-\int_{-\infty}^{\infty} u(x) \cdot (-i\omega) e^{-i\omega x} dx$ . So again  $e^{-i\omega x}$  with axis bounded,  $u$  goes to 0 when  $x$  goes to  $+\infty$  so this part goes to 0 and this becomes then  $-\int_{-\infty}^{\infty} u(x) \cdot (-i\omega)^2 e^{-i\omega x} dx$  becomes  $i^2 \omega^2 \int_{-\infty}^{\infty} u(x) e^{-i\omega x} dx$ .

So we get  $-\frac{1}{\sqrt{2\pi}} \omega^2 \int_{-\infty}^{\infty} u(x) e^{-i\omega x} dx$  okay. So  $-\omega^2$  times  $U(\omega, t)$ , this is nothing but  $-\omega^2$  times Fourier transform of  $u$  function okay so  $F(u_{xx}, t)$ , which we are denoting by  $U(\omega, t)$  so  $-\omega^2 U(\omega, t)$ . So Fourier transform of second derivative of  $u$  with respect to  $x$  is replaced with  $-\omega^2 U(\omega, t)$  in the problems.

**(Refer Slide Time: 35:09)**

If  $U_s(\omega, t)$  and  $U_c(\omega, t)$  are Fourier sine and cosine transforms of  $u(x, t)$ , then

$$U_s(\omega, t) = \int_0^{\infty} u(x, t) \sin \omega x \, dx$$

Hence

$$F_s \left( \frac{\partial^2 u}{\partial x^2} \right) = \omega u(x, t) \Big|_{x=0} - \omega^2 U_s(\omega, t).$$

Similarly,

$$U_c(\omega, t) = \int_0^{\infty} u(x, t) \cos \omega x \, dx$$

Hence

$$F_c \left( \frac{\partial^2 u}{\partial x^2} \right) = - \left( \frac{\partial u}{\partial x} \right) \Big|_{x=0} - \omega^2 U_c(\omega, t).$$

 IIT KHARAGPUR
  NPTEL ONLINE CERTIFICATION COURSE
 20

Similarly,  $U_s(\omega, t)$  represents Fourier sine transform of  $f(x)$ ;  $U_c(\omega, t)$  represent Fourier cosine transform of the function  $f(x)$  okay. So then  $U_s(\omega, t) = \int_0^{\infty} u(x, t) \sin \omega x \, dx$  we are taking this coefficient instead of  $\sqrt{2/\pi}$  as 1. Then,  $F_s \left( \frac{\partial^2 u}{\partial x^2} \right) = \omega u(x, t) \Big|_{x=0} - \omega^2 U_s(\omega, t)$  and similarly for the Fourier cosine transform if you find the Fourier cosine transform of  $U(x, x)$  it becomes  $-\left( \frac{\partial u}{\partial x} \right) \Big|_{x=0} - \omega^2 U_c(\omega, t)$ .

Here again like we use the boundedness of  $e$  to the power  $-i \omega x$  here to make this term 0, there also because of instead of  $e$  to power  $-\omega x$  we will have  $\sin \omega x$  and  $\cos \omega x$ , they are bounded quantities, they are bounded by 1. So we will see that this expression again in the case of  $\sin \omega x$  and  $\cos \omega x$  goes to 0. So we can easily prove these formulas.

**(Refer Slide Time: 36:19)**

In one dimensional problems, the PDE is transformed into an ODE by applying a suitable transform.

If in a problem  $u(x, t)|_{x=0}$  is given then we use Fourier sine transform to

remove  $\frac{\partial^2 u}{\partial x^2}$ .

In case  $\left(\frac{\partial u}{\partial t}(x, t)\right)_{x=0}$  is given then the Fourier cosine transform is applied

to remove  $\frac{\partial^2 u}{\partial x^2}$ .

o

Now in one-dimensional problem the PDE is transformed into an ODE by applying a suitable transform. If in a problem  $u(x, t)$  at  $x=0$  is given you see here in this formula when you take Fourier sine transform of this  $U(x, \omega)$  you are having the expression as  $\omega^2 u(x, t)$  at  $x=0$  while in the case of Fourier cosine transform you have  $-\Delta u / \Delta x$  at  $x=0$ . So if in a problem you have  $u(x, t)$  at  $x=0$  is given then you use Fourier sine transform.

If in the problem the boundary condition is given as  $-\Delta u / \Delta x$  at  $x=0$  then you use Fourier cosine transform. So which is the transform that is to be used depends on the given boundary conditions.

**(Refer Slide Time: 37:10)**

**Example:** Determine the distribution of temperature in the semi-infinite medium  $x \geq 0$ , when the end  $x = 0$  is maintained at zero temperature and the initial distribution of temperature is  $f(x)$ .

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$$

$$u(0, t) = 0 \quad \forall t$$

$$u(x, 0) = f(x)$$

$$U_A(\omega, t) = \int_0^\infty u(x, t) \sin \omega x \, dx$$

$$U_B(\omega, t) = \int_0^\infty u(x, t) \cos \omega x \, dx = \frac{1}{\omega} \int_0^\infty f(x) \sin \omega x \, dx = \frac{1}{\omega} F_A(\omega)$$

$$\frac{\partial}{\partial t} \left( \int_0^\infty u \sin \omega x \, dx \right) = c^2 \int_0^\infty \frac{\partial^2 u}{\partial x^2} \sin \omega x \, dx$$

$$\frac{\partial}{\partial t} \left( \int_0^\infty u \sin \omega x \, dx \right) = c^2 F_A \left( \frac{\partial^2 u}{\partial x^2} \right) = c^2 \left[ \omega u(x, t) \Big|_{x=0} - \omega^2 U_A(\omega, t) \right] = -c^2 \omega^2 U_A(\omega, t)$$

$$\frac{\partial}{\partial t} U_A(\omega, t) + c^2 \omega^2 U_A(\omega, t) = 0 \Rightarrow \ln U_A(\omega, t) = -c^2 \omega^2 t + A(\omega)$$

$$U_A(\omega, t) = A(\omega) e^{-c^2 \omega^2 t}$$

$$U_B(\omega, t) = \frac{1}{\omega} F_A(\omega) e^{-c^2 \omega^2 t}$$

$$U_B(\omega, t) = A(\omega) = \frac{1}{\omega} F_A(\omega)$$

$$\frac{\partial}{\partial t} \int_0^\infty U_B(\omega, t) \cos \omega x \, d\omega = \frac{\partial}{\partial t} \int_0^\infty \frac{1}{\omega} F_A(\omega) e^{-c^2 \omega^2 t} \cos \omega x \, d\omega$$

Now let us look at this problem. Determine the distribution of temperature in the semi-infinite medium  $x \geq 0$ , when the end  $x=0$  is maintained at zero temperature and the initial

distribution of temperature is  $f(x)$ . So we have this equation we have  $\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$ . Now the boundary condition here is that at  $x=0$  temperature is 0, so  $u(0, t) = 0$  for all the time  $t$  and we are given initial temperature distribution as  $u(x, 0) = f(x)$ .

Now you can see we are given  $u(x, t)$  at  $x=0$  when  $u(x, t)$  at  $x=0$  is given we use Fourier sine transform. So let us take the Fourier sine transform of the given equation, this one okay. So taking Fourier sine transform means you multiply both sides with  $\sin(\omega x)$  and then integrate with respect to  $x$  okay. So  $\frac{\partial u}{\partial t} \sin(\omega x) dx$  and we integrate over 0 to infinity.

Right side will be  $c^2$  times integral over 0 to infinity  $\frac{\partial^2 u}{\partial x^2} \sin(\omega x) dx$  okay. Now  $x$  and  $t$  are independent variable so here integration is with respect to  $x$  so I can write this also as this is Fourier sine transform of  $u_{xx}$  and we can then use the formula  $c^2$  times Fourier sine transform of  $u_{xx}$  we have seen it is  $-\omega^2 u(x, t)$  at  $x=0$   $-\omega^2 U_s(\omega, t)$ .

So we can put the value  $\omega$  times  $u(x, t)$  at  $x=0$   $-\omega^2 U_s(\omega, t)$  okay,  $u(x, t)$  at  $x=0$  is given it is 0 so we get here  $-c^2 \omega^2 U_s(\omega, t)$  okay and left hand side is what this is  $U_s(\omega, t)$ , left hand side is this, so that we have  $+c^2 \omega^2 U_s(\omega, t)$ . Now it can be treated as a first order differential equation  $\frac{du}{dt} + c^2 \omega^2 u$  and then its solution will be  $\frac{du}{u}$  so  $\ln U_s(\omega, t) = -c^2 \omega^2 t + \text{some constant}$ .

Now because it is partial derivative the constant of integration will depend on  $\omega$ . So we can call it as  $\ln A(\omega)$ . So then  $U_s(\omega, t)$  will be  $A(\omega) e^{-c^2 \omega^2 t}$ . Now at  $t=0$   $u(x, 0) = f(x)$ . Let us look at this, so from here we have  $U_s(\omega, t=0)$  to infinity we have taken  $u(x, 0) \sin(\omega x) dx$ . This we defined so we put  $t=0$  in this then  $U_s(\omega, 0) = \int_0^\infty u(x, 0) \sin(\omega x) dx$ .

And this is nothing but  $\int_0^\infty u(x, 0) \sin(\omega x) dx$ , this is Fourier transform of  $f(x)$  so I can write it as  $\bar{f}_s(\omega)$  okay. So what we will have we put  $t=0$ , so  $U_s(\omega, 0) = \bar{f}_s(\omega)$  okay,  $U_s(\omega, 0)$  is  $\bar{f}_s(\omega)$  okay Fourier sine transform of  $f(x)$  okay. Thus,  $U_s(\omega, t)$  becomes  $\bar{f}_s(\omega) e^{-c^2 \omega^2 t}$ . Now let us use the inversion formula for the Fourier sine transform.

Because here we are taking one coefficient okay now while inverting we will take  $2/\pi$ . So we multiply both sides by  $\sin \omega x$ , integrate over 0 to infinity with respect to  $\omega$  and multiply by  $2/\pi$ . So  $2/\pi \int_0^{\infty} U_s(\omega, t) \sin \omega x d\omega = 2/\pi \int_0^{\infty} \bar{f}_s(\omega) e^{-c^2 \omega^2 t} \sin \omega x d\omega$  okay. Now left hand side is  $f(x)$  and so we get this result.

**(Refer Slide Time: 43:08)**

Then,

$$u(x, t) = \frac{2}{\pi} \int_0^{\infty} \bar{f}_s(\omega) e^{-c^2 \omega^2 t} \sin \omega x d\omega.$$

o

So left hand side is  $u(x, t)$  okay, left hand side is the inversion formula for  $u(x, t)$  so left hand side is  $u(x, t)$ . So  $u(x, t) = 2/\pi \int_0^{\infty} \bar{f}_s(\omega) e^{-c^2 \omega^2 t} \sin \omega x d\omega$ . So this is how we solve this boundary value problem. With that I will like to end my lecture. Thank you very much for your attention.
