Partially Ordered Set 1

Hello friends, welcome to my lecture on Partially Ordered Sets. So let us begin with the first lecture on Partially Ordered Sets. A binary relation or simply relation from a set A to a set B is a subset of $A \times B$. So if you denote the relation by R then R is a subset of $A \times B$.

(Refer Slide Time: 00:53)

Relation

A binary relation, or simply relation, from a set A to a set B is a subset R of $A \times B$. Given $a \in A$ and $b \in B$, we write aRb or $a \mathrel{R} b$ according as $(a, b) \in R$ or (a, b) does not belong to R . If R is a relation from A to A , i.e., if $R \subseteq A \times A$, then we say R is a relation on A .

$R \subseteq A \times B$
 $(a, b) \in R \Leftrightarrow aRb$
 $(a, b) \notin R \Leftrightarrow a \not R b$

 IIT ROORKEE  NPTEL ONLINE CERTIFICATION COURSE 2

Let us say we have an element a belonging to A and b belonging to B then we write $a R b$ or a not at $R b$, Ok according as $(a, b) \in R$. So if $(a, b) \in R$ it means that a is related to b . Ok. And if (a, b) does not belong to R then we say that a is not R related to b , Ok.

So given two elements a in A and b in B , we say that a is related to b or a is not related to b according as (a, b) is in R or (a, b) is not there in R . If R is a relation from A to A , then R is a subset of $A \times A$ and we say that R is a relation on A .

(Refer Slide Time: 01:47)

Let R be a relation from A to B . The domain of R is the subset of A consisting of the first elements of the ordered pairs of R , and the range of R is the subset of B consisting of the second elements.

Now let us say R be a relation from A to B . That means R is a subset of $A \times B$. Then what is the domain of R ? The domain of R is the subset of A consisting of the first elements of the ordered pairs of R , Ok. So in the domain of R , consider all the ordered pairs of R . Then their first elements, their first elements constitute the domain of R while the range of R is the subset of B consisting of the second elements of all the ordered pairs of R .

So if we consider all the ordered pairs of R then you figure out all the second elements there, Ok. They constitute the range of R . And obviously it will be a subset of B . Now let us say the, let us define the inverse of the relation R .

(Refer Slide Time: 02:41)

The inverse of R , denoted R^{-1} , the relation from B to A which consists of those ordered pairs which when reversed to R ; that is,

$$R^{-1} = \{(b, a) : (a, b) \in R\}$$

Then inverse of R denoted by R^{-1} inverse is defined as the relation from B to A which consists of those ordered pairs which when reversed to R , that is R^{-1} inverse is (b, a) when $(a, b) \in R$. So whatever ordered pairs are there, say a, b there in R ; R inverse will consist of the ordered pairs (b, a) . So the second element b in R will become the first element in R^{-1} and the first element a in R will become the second element a in R^{-1} .

(Refer Slide Time: 03:21)

Example

Determine which of the following are relations from $A = \{a, b, c\}$ to $B = \{1, 2\}$:

- ① $R_1 = \{(a, 1), (a, 2), (c, 2)\}$ *Relation* $R_1 \subset A \times B = \{(a, 1), (a, 2), (b, 1), (b, 2), (c, 1), (c, 2)\}$
- ② $R_2 = \{(c, 1), (c, 2), (c, 3)\}$ $R_2 \not\subset A \times B \therefore R_2$ is not a relation in $A \times B$
- ③ $R_3 = \phi$, the empty set $R_3 \subset A \times B$
Relation in $A \times B$ known as empty relation
- ④ $R_4 = A \times B$. $R_4 \subset A \times B$
Universal relation

5

Now let us determine which of the following are relations from $A = \{a, b, c\}$ to $B = \{1, 2\}$, Ok. So here R_1 is given as $(a, 1), (a, 2), (c, 2)$ Ok. So you can see R_1 is clearly a subset of $A \times B$, Ok. $A \times B$ is consisting of all the elements say, $(a, 1), (a, 2), (b, 1), (b, 2), (c, 1), (c, 2)$, Ok. So R_1 is a subset of $A \times B$ because $(a, 1)$ is there in $A \times B$, $(a, 2)$ is there in $A \times B$ and $(c, 2)$ is also there in $A \times B$. So R_1 is a subset of $A \times B$ and therefore R_1 defines a relation in $A \times B$, Ok. So this is a relation.

Now let us look at R_2 . R_2 consists of $(c, 1), (c, 2)$ which are there in $A \times B$ but $(c, 3), (c, 3)$ is not there in $A \times B$. So R_2 is not a subset of $A \times B$. And therefore R_2 is not a relation in $A \times B$. So R_2 Now R_3 . R_3 equal to empty. The empty set is always a relation because ϕ , R_3 , equal to ϕ , R_3 , is always a subset of $A \times B$, Ok.

ϕ is a subset of $A \times B$. This is empty set. This is called, there is always a relation, there always defines a relation in $A \times B$. It is known as empty relation, Ok, known as... And when here R_4 , is $A \times B$, the entire set $A \times B$ so clearly R_4 is a subset of $A \times B$, Ok. So R_4 is a relation in $A \times B$ and it is called as, because it is the complete set $A \times B$ so we call it as

universal relation. So out of these four, the second one that is R_2 is not a relation in $A \times B$ while the others are all relations in $A \times B$.

(Refer Slide Time: 06:15)

Let R be a relation on $A = \{1, 2, 3, 4\}$ defined by "x is less than y", that is, R is a relation $<$. Write R as a set of ordered pairs. Also, find the inverse R^{-1} of the relation R .

$$A \times A = \{ (1,1), (1,2), (1,3), (1,4), (2,1), (2,2), (2,3), (2,4), (3,1), (3,2), (3,3), (3,4), (4,1), (4,2), (4,3), (4,4) \}$$

$$R = \{ (x,y) : x < y \}$$

$$= \{ (1,2), (1,3), (1,4), (2,3), (2,4), (3,4) \}$$

$$R^{-1} = \{ (y,x) : (x,y) \in R \} = \{ (2,1), (3,1), (4,1), (3,2), (4,2), (4,3) \}$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

Now let us consider this example. Let R be a relation on A , Ok. A is $\{1, 2, 3\}$. Ok. R be a relation on A means R is a subset of $A \times A$ and it is defined by x is less than y , Ok. That is R is a relation less than, Ok. So write R as a set of ordered pairs. So let us see, $A \times A$ will consist of elements like $(1, 1), (1, 2), (1, 3), (1, 4), (2, 1), (2, 2), (2, 3), (2, 4), (3, 1), (3, 2), (3, 3), (3, 4), (4, 1), (4, 2), (4, 3)$ and $(4, 4)$. Ok now R will consist of those ordered pairs where x is less than y . So if (x, y) is an element of R then x should be less than y .

So R is the set of those ordered pairs $\{(x, y) : x < y\}$. So let us see how many, which are the ordered pairs which satisfy that the first element x is less than the second element y , Ok. So here $(1, 1), (1, 2), (1, 3)$ we can take because 1 is less than 2, $(1, 3)$ we can take, $(1, 4)$ we can take, then we can take, $(2, 3)$ Ok, because 2 is less than 3, then we can take $(2, 4)$. We can take then $(3, 4)$, Ok, then yeah.

So R is equal to the set of ordered pairs $(1, 2), (1, 3), (1, 4), (2, 3)$ and then $(2, 4)$ and then $(3, 4)$, Ok. Because in all these ordered pairs the x , that is first element is less than the y , second element. In all others this condition does not hold good, Ok. Now, so now write R is a set of ordered pairs, also find the inverse, R inverse of the relation R .

So R inverse is equal to, if $(x, y) \in R$ then $(y, x) \in R^{-1}$. So we have (y, x) , Ok where $(x, y) \in R$. So this will consist of $(1, 2)$ will become $(2, 1)$, $(1, 3)$ will become $(3, 1)$, $(1, 4)$ becomes $(4, 1)$, $(2, 3)$ will become $(3, 2)$, $(2, 4)$ will become $(4, 2)$, and $(3, 4)$ will become $(4, 3)$.

1), (2 3) becomes (3 2), (2 4) becomes (4 2) and (3 4) becomes (4 3). So here the first element Ok is y and y is then greater than x, it is greater than the second element. So this is how we find the inverse of R.

(Refer Slide Time: 09:51)

Partially ordered set

Suppose R is a relation on a set S satisfying the following three properties:

- 1 [O₁] Reflexive: aRa for every $a \in S$. (a, a) ∈ R
- 2 [O₂] Antisymmetric: If aRb and bRa , then $a = b$.
- 3 [O₃] Transitive: If aRb and bRc , then aRc .

Then R is called a partial order or an order relation, and S together with the partial order is called partially ordered set or simply, an ordered set or poset. POSET

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

Now let us define partially ordered set. Suppose R is a relation on a set S which satisfies the following three properties. First property is reflexive. a is related to a, that is $(a, a) \in R$, Ok. That is the first property for every $a \in S$. Antisymmetric, if a related to b that is $(a, b) \in R$ and $(b, a) \in R$ that will happen only when a is equal to b. So if relation is symmetric then if a R b and b R a, Ok both hold, a is related to b and b is related to a, then a must be equal to b.

Now the third property transitive, if a is related to b and b is related to c, then a is related to c. That means if $a, b \in R$ and $b, c \in R$ then a, c also $\in R$. We shall then call R to be a partial order or an order relation, an order relation on S together with the partial order relation will be then called partially ordered set. Or we call it as an ordered set. Or in brief we call it as a poset, POSET means partially ordered set.

(Refer Slide Time: 11:10)

Define the usual order on the positive integers \mathbb{N} , and describe the usual notation for a partially ordered set.

The usual order, is the relation \leq on \mathbb{N} or more generally, on any subset of \mathbb{R} . A partial order relation is usually denoted by \preceq ; and $a \preceq b$ is read "a precedes b". We also write:

$a \prec b$ (read "a strictly precedes b") if $a \preceq b$ but $a \neq b$
 $a \succ b$ (read "a succeeds b") if $b \preceq a$
 $a \succ b$ (read "a strictly succeeds b") if $b \prec a$.

Now let us define the usual order, \leq on the set of positive integers, \mathbb{N} . On the set of positive integers and the usual order is the relation \leq , which is also there on any subset of the set of real numbers. A partial order relation is usually denoted by this symbol, \preceq , this symbol and what is the meaning of this symbol? If this is the symbol is there between a and b we say that $a \preceq b$, Ok. $a \preceq b$ if we have this symbol Ok where this one is not there, Ok. Then we say that $a < b$. Now $a < b$ means $a \preceq b$ but $a \neq b$, Ok.

Now if we have \geq symbol, Ok this means that $a \geq b$, $a \geq b$ if $b \preceq a$, Ok. You can see this symbol, \preceq symbol means precedes. So if $b \preceq a$ then $a \geq b$. Now if \geq symbol is there we say that a strictly succeeds b, Ok if $b < a$. So we shall make use of these symbols on a partially ordered set.

(Refer Slide Time: 12:31)

$ARB \Rightarrow A \subseteq B$
 $BRC \Rightarrow B \subseteq C$
 $A \subseteq B \text{ and } B \subseteq C \Rightarrow A \subseteq C$
 $\Rightarrow ARC$

Example

Consider $P(S)$ as the power set i.e., the set of all subsets of a given set S . Show that the inclusion relation \subseteq is a partially ordering on the power set $P(S)$.

Reflexive $aRa, \forall a \in S$
 Let $A \in P(S)$
 then AA because $A \subseteq A$

Antisymmetric Let ARB and BRA
 $ARB \Rightarrow A \subseteq B$
 $BRA \Rightarrow B \subseteq A$
 $A \subseteq B \text{ and } B \subseteq A \Rightarrow A=B$
Transitive of ARB and BRC then ARC

IIT ROORKEE
 NPTEL ONLINE CERTIFICATION COURSE

Now consider $P(S)$ as the power set. Let us consider the power set of, the set of, that is the set of all subsets of a given set S so that the inclusion relation is a partial ordering on the power set S . Ok. So first thing that we have to see is reflexive. Reflexive means a is related to a for all a belonging to S . This is the first thing we have to see. So let us take a set in $P(S)$, Ok. Let $A \in P(S)$, the power set of S , Ok.

Then A is related to A because A is contained in A , Ok. This is always true. Relation here is this inclusion relation. So A is always contained in A . So we say that A is related to A . So this reflexive property holds. Then antisymmetric, so let A is B related to B and B be R related to A , Ok. Then we have to show A is equal to B . Now $A R B$ means A is contained in B , Ok. And B is related to R means, B is related to A means B is contained in A , Ok.

So A contained in B and B contained in A implies that A is equal to B . If A is subset of B and B is subset of A then they must be equal. So A is equal to B and so therefore if A is related to B by inclusion relation and B is related to A by the inclusion relation then A must be equal to B . So antisymmetric property holds. And the third one is transitive property. So if A is related to B and B is related to C , Ok then we have to show A is related to C . Ok.

So A is related to B implies that A is contained in B and B is related to C means B is contained in C . Now A is contained in B and B is contained in C implies that A is contained in C . Which means that A is related to C , Ok? So the transitive property also holds. And therefore the relation, inclusion relation is partial ordering on the power set S of the given set S .

(Refer Slide Time: 15:44)

Example
Show that the relation \geq is a partially ordering on the set of integers, Z .

Reflexive: Let $a \in Z$
then we know $a \geq a$ & so $a R a$

Anti-Symmetric: Let $a R b$ and $b R a$, $a, b \in Z$
then $a R b \Rightarrow a \geq b$
& $b R a \Rightarrow b \geq a$

Transitive: Let $a R b$ and $b R c$ and $a \geq b$ and $b \geq a$ or $a \leq b \leq a$
then $a R b \Rightarrow a \geq b$ and $b R c \Rightarrow b \geq c$
now $a \geq b$ and $b \geq c$
 $\Rightarrow a \geq c \Rightarrow a R c$

IT ROORKEE
NPTEL ONLINE
CERTIFICATION COURSE

Now let us show the relation greater than or equal to is a partial ordering on the set of integers Z , Ok. So first we prove that reflexive property. Take any a belonging to Z . Let a be any integer, Ok. Then we know a is always greater than or equal to a , Ok. And so a is R related to a , Ok. Then reflexive, after that reflexive, we go to antisymmetric. So let us say a is R related to b and b is R related to a , Ok. a, b belong to Z ,

Ok. Then a is R related to b implies $a \geq b$. And b R related to a implies $b \geq a$, Ok. So this means what? So $a \geq b$ and $b \geq a$ together can hold, Ok only when they are equal because this also I can write as b greater than or equal to a means a less than or equal to b and b less than or equal to a , Ok.

So a less than or equal to b less than or equal to a implies a is equal to b , Ok. Now then we go to transitive. So let us say, a is R related to b and b is R related to c , Ok. Then we have to prove that a is R related to c . So a is R related to b implies $a \geq b$ and b is R related to c implies $b \geq c$.

Now $a \geq b$, and $b \geq c$ implies that $a \geq c$. So, so this means that the relation \geq is a partial ordering on the set of integers Z .

(Refer Slide Time: 18:19)

$$c = k_2 b \Rightarrow c = k_2 k_1 a \\ \Rightarrow a | c \text{ as } k_1, k_2 \in \mathbb{N}$$

Example

Consider the positive integers \mathbb{N} . Then the divisibility is a partial ordering set or

Reflexive: Let $a \in \mathbb{N}$
then $a|a$ hence aRa

Anti-Symmetric: Let aRb and bRa then
 $aRb \Rightarrow a|b \Rightarrow b = k_1 a$ for some positive integer k_1
 $bRa \Rightarrow b|a \Rightarrow a = k_2 b$ for some $k_2 \in \mathbb{N}$

Transitive: Let aRb and bRc
 then $a|b$ and $b|c$
 $a|b \Rightarrow b = k_1 a$ for some $k_1 \in \mathbb{N}$
 $b|c \Rightarrow c = k_2 b$ for some $k_2 \in \mathbb{N}$

$b = k_1 k_2 a \Rightarrow 1 = k_1 k_2 \Rightarrow k_1 = k_2 = 1$
 we have $a = b$

Now consider the set of positive integers \mathbb{N} , the set of natural numbers \mathbb{N} . Then the divisibility is a partial ordering on the set \mathbb{N} . Let us prove that. So reflexive, Ok so let a belong to \mathbb{N} , a belong to \mathbb{N} , a be an integer, positive integer then $a | a$. We know $a | a$? Ok. Hence a is related to a . Ok. This is valid for any a belonging to \mathbb{N} ?

Then antisymmetric, let a be related to b and b be related to a . $a R b$, and $b R a$, Ok. Then $a R b$ implies $a | b$ which means that $b = k_1 \times a$ for some positive integer k , for some positive integer k_1 , Ok. b is R related to a implies $b | a$, Ok which implies that a is k_2 times b for some k_2 belonging to \mathbb{N} for some positive integer k_2 belonging to \mathbb{N} . Now from here what we can see, from this equation and this equation we find that $b = k_1 \cdot a$. a we can put as $k_2 \cdot b$. So $b = k_2 k_1 b$, Ok.

Now b is a positive integer. So we can divide by b so this implies $1 = k_2 k_1$. Now k_2, k_1 are both positive integers and their product is 1. It means that $k_1 = k_2 = 1$, Ok. So what we will get, k_1 and k_2 both are equal to 1, so we will get b equal a , a equal to b . That means we have, so transitive, so, so antisymmetric property holds. Now next we go to transitive property, Ok. So let us say a be R related to b , b be R related to c , Ok, b be R related to c then $a | b$ and $b | c$, Ok. $a | b$ implies b equal to $k_1 a$ for some k_1 belonging to \mathbb{N} , Ok. And $b | c$ implies c is equal to $k_2 b$ for some k_2 belonging to \mathbb{N} , Ok.

So what do we get? $a | b$ gives b equal to $k_1 a$ and $b | c$ gives c is equal to $k_2 \cdot b$, Ok. So let us replace the value of b equal to $k_1 a$ in the equation c equal to $k_2 b$. So c equal to $k_2 \cdot b$ gives c equal to $k_2 \cdot k_1 \cdot a$, Ok. k_1, k_2 are positive integers so k_1 into k_2 is also positive integer. So this

means that $a \mid c$ as $k_1, k_2 \in \mathbb{N}$, Ok, so the, when we consider the set of positive integers \mathbb{N} that divisibility is a partial ordering on the set \mathbb{N} .

(Refer Slide Time: 22:45)

Handwritten notes:
 aRb and bRc
 then $aRb \Rightarrow a \geq b \Rightarrow b \leq a$
 and $bRc \Rightarrow b \geq c \Rightarrow c \leq b$
 $a \leq b$ a precedes b
 $c \leq b$ and $b \leq a \Rightarrow c \leq a \Rightarrow a \geq c \Rightarrow aRc$
 $a \geq b$ 'a succeeds b'

Definition
 Let \leq be a partial ordering of a set S . Then the relation \geq , i.e., a succeeds b , is also a partial ordering of S , called the dual order. Note $a \geq b$ if and only if $b \leq a$; hence \geq is the inverse of the relation \leq , that is, $\geq = \leq^{-1}$.

Example:
 Describe the dual (inverse) order of the following relations:
 (a) set inclusion \subseteq , (b) divisibility on \mathbb{N} .

Handwritten notes for Example:
 Reflexive: Let $a \in S$.
 then aRa i.e. $a \geq a$
 $a \leq a$ i.e. 'a precedes a'
 Anti-Symmetric:
 Let aRb and bRa then $a \geq b$ and $b \geq a$
 $a \geq b \Rightarrow b \leq a$ and $b \geq a \Rightarrow a \leq b$

Handwritten notes for (a):
 $a \subseteq b$ and $b \subseteq a$
 $\Rightarrow a = b$
 Transitive:

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

Now let us go to this symbol which we talked about earlier. This means when \leq symbol is there between a and b , Ok we say that $a \leq b$, Ok. So let this be a partial ordering of S at S . Then the relation this, Ok, this relation means \geq , Ok. When it is there between a and b it will mean that $a \geq b$, Ok. So to show that this relation is also a partial ordering of S ; it is called the dual order, Ok. So let us see. We have to show that, this is a, first we show the reflexive property. Reflexive property means we have to show that let $a \in S$. Let $a \in S$. Then a is R related to a . a is related to a .

This means we have to prove that, that is this, Ok. Now there is already a partial ordering of the set S . That means, sorry $a \leq a$. This is given, this is already there. That is $a \leq a$, Ok. This is partial ordering on the set S . So with respect to this partial ordering S is reflexive. This is a reflexive relation on S so this means $a \leq a$ is always there. When $a \leq a$ then this $a \geq a$ this a , Ok. So $a \geq a$, Ok. So a is related to a .

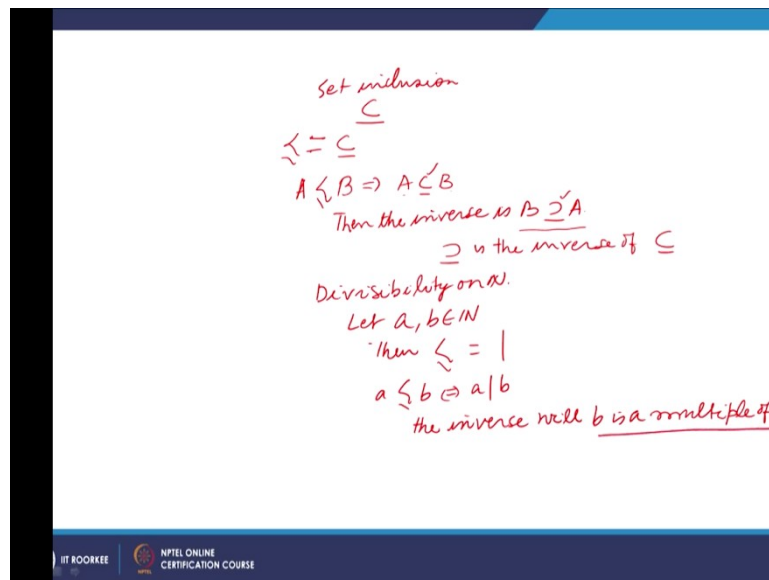

And then let us prove the antisymmetric. Antisymmetric, let us say, let a be related to b and b be related to a , Ok. Then we have to show that a and b are equal. So a is related to b means $a \geq b$ and $b \geq a$, Ok. $a \geq b$ and $b \geq a$. Now $a \geq b$ means $b \leq a$, Ok and $b \geq a$ implies $a \leq b$, Ok. Now so that what we have? $a \leq b$ and $b \leq a$, Ok. Then by the fact that this partial ordering is transitive, Ok, so $a \leq b$ means, $a \leq b$ and $b \leq a$, Ok.

Now this is a partial ordering on the set. So with respect to this partial ordering we have antisymmetric property and that implies that $a = b$, Ok. Because this is nothing but, this is nothing but the antisymmetric case for this partial ordering, Ok. Now the third one, transitive. So let us say a be related to b and b be related to c , Ok. Then $a R b$ implies $a \geq b$, Ok and b related to c implies $b \geq c$.

Now $a \geq b$ means $b \leq a$, Ok. And $b \geq c$ means $c \leq b$, Ok. So now $c \leq b$, and $c \leq b$ and $b \leq a$, Ok and this is a partial ordering of the set S . Therefore with this partial ordering, this partial ordering is transitive. So $c \leq b$ and $b \leq a$ implies $c \leq a$, Ok which is same as $a \geq c$, Ok. $a \geq c$ that means a is related to c , Ok. So that is how we show that this notation, Ok, which is the notation that $a \geq b$ is also a partial ordering of S .

And it is then therefore called; it is called dual order, Ok. Now $a \geq b$, if and only if $b \leq a$. $a \geq b$ if and only if $b \leq a$, Ok. Hence this notation Ok which is the notation for \geq , $a \geq b$. So this notation is the inverse of the notation $a \leq b$, Ok. This is the notation for $a \leq b$ and this is the notation for $a \geq b$. So this is inverse of this relation and we show it by writing this notation for $a \leq b$ is equal to $a \geq b$ inverse, this notation, inverse of this notation.

(Refer Slide Time: 29:09)

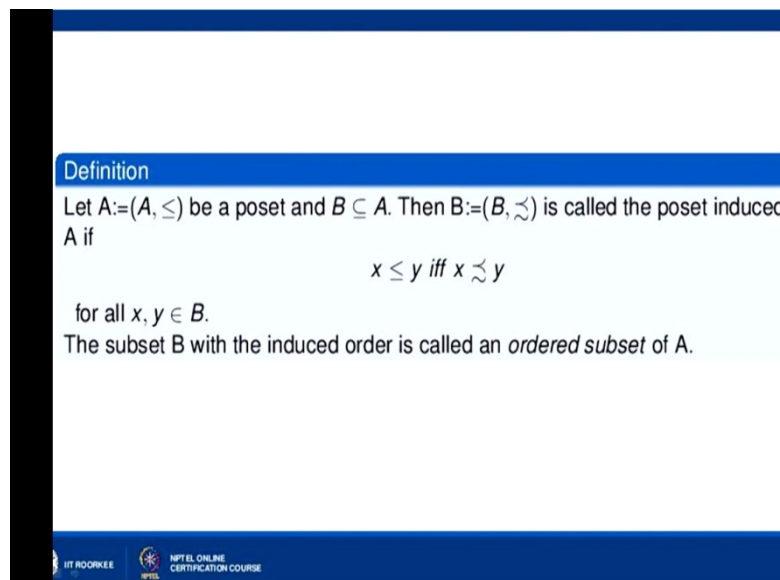

Now describe the dual order of the following relations. Set inclusion, Ok. So let us go to set inclusion first. Ok so this. We want to know what is the inverse of this, Ok. So inverse of this means let us say this is the notation this. This is same as this, Ok. So $A \leq B$ Ok means that A

is subset of B, Ok. So the inverse of this will be then the inverse of, then the inverse of...Then the inverse is B contains A.

So when you write the inverse of A contained in B what you get is B contains A. Ok so this is the notation for set inclusion. This is the notation for set containment. So B contains A. So this notation is the inverse of this. Now the next case was divisibility on N, Ok. So let us see what is the inverse of divisibility on N? So divisibility, so let us say, let a, b belong to N. Then this notation Ok is division, Ok.

So a means that $a \mid b$, Ok. $a \mid b$ means, $a \mid b$ Ok that means we can say, inverse will be, the inverse will be b is a multiple of a, Ok. When $a \mid b$ its inverse is b is a multiple of a, Ok.

(Refer Slide Time: 31:29)

Definition
Let $A := (A, \leq)$ be a poset and $B \subseteq A$. Then $B := (B, \preceq)$ is called the poset induced on A if

$$x \leq y \text{ iff } x \preceq y$$

for all $x, y \in B$.
The subset B with the induced order is called an *ordered subset* of A.

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

Now we go to this definition. So let (A, \leq) be a poset, Ok. This is the order relation on A and $B \subseteq A$. It is not necessary that it is less than or equal to, it is some relation on A.

(Refer Slide Time: 32:41)

Example:

Suppose \mathbb{N} is ordered by divisibility. Determine whether or not A is an ordered subset of \mathbb{N} where:

(a) $A = \{2, 3, 4, 5, 6\}$ with the usual order, and (b) $A = \{2, 4, 8, 32\}$ with the usual order.

So let this be a poset. And $B \subset A$, then $B := (B, \leq)$ is called the poset induced by A if x less than or equal to y if and only if $x \leq y$, Ok. So suppose A is a partially ordered set. It is a poset with the partial ordered relation given by this notation, Ok. And $B \subset A$. Then B will be called a poset, Ok induced by A if x less than or equal to y , you take any two elements x, y belonging to B Ok then x less than or equal to y , Ok as, because this is relation in A .

So x less than or equal to y in A if and only if $x \leq y$, Ok in B . Ok so that should hold. So the subset B with the induced order, with the induced order is called an ordered subset of A . Now let us look at an example on this. Suppose \mathbb{N} is ordered by divisibility, Ok. \mathbb{N} is ordered by divisibility. Determine whether or not A is an ordered subset of \mathbb{N} where A is consisting of $\{2, 3, 4, 5, 6\}$ with the usual order. Usual order means less than or equal to, Ok. Usual order as we have seen earlier, it means less than or equal to.

(Refer Slide Time: 33:09)

Definition

Let $A := (A, \leq)$ be a poset and $B \subseteq A$. Then $B := (B, \lesssim)$ is called the poset induced by A if

$$x \leq y \text{ iff } x \lesssim y$$

for all $x, y \in B$.

The subset B with the induced order is called an *ordered subset* of A .

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

Now you can see A will be the set induced by S , induced by N provided A will be called the poset induced by N whenever you take any two elements in A , Ok we have $A \leq B$ if and only if $A \leq y$. N less than or equal to is the notation for the partial order in the set A .

(Refer Slide Time: 33:33)

Example:

Suppose \mathbb{N} is ordered by divisibility. Determine whether or not A is an ordered subset of \mathbb{N} where:

(a) $A = \{2, 3, 4, 5, 6\}$ with the usual order, and (b) $A = \{2, 4, 8, 32\}$ with the usual order.

\leq

$2, 3 \in A$
-then $2 \leq 3$ but $2 \nmid 3$

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

So what we have here? We can see that 2, 3 Ok, 2, let us take 2, 3 belonging to A , Ok. Then $2 \leq 3$, Ok. $2 \leq 3$ but, but 2 does not divide 3, Ok. In \mathbb{N} , \mathbb{N} is partially, partial order relation in \mathbb{N} is divisibility, Ok. So we have taken x to be 2, y to be 3, Ok and then we see that with respect to the usual order in A , Ok, 2 and 3 are related. $2 \leq 3$. But 2 is not, 2 does not divide 3. So this condition does not hold, this one.

(Refer Slide Time: 34:23)

Definition
Let $A := (A, \leq)$ be a poset and $B \subseteq A$. Then $B := (B, \lesssim)$ is called the poset induced by A if

$$x \leq y \text{ iff } x \lesssim y$$

for all $x, y \in B$.
The subset B with the induced order is called an *ordered subset* of A.

$2 \lesssim 4 \Leftrightarrow 2 \leq 4$

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

$x \leq y$, we should have $x \lesssim y$ if and only if $x \leq y$. This is the order relation in this subset. And this is the order relation in the given set. So here the order relation in \mathbb{N} is divisibility, Ok. So this holds but this does not hold.

(Refer Slide Time: 34:46)

Example:
Suppose \mathbb{N} is ordered by divisibility. Determine whether or not A is an ordered subset of \mathbb{N} where:
(a) $A = \{2, 3, 4, 5, 6\}$ with the usual order, and (b) $A = \{2, 4, 8, 32\}$ with the usual order.

\leq

$2, 3 \in A$
then $2 \leq 3$ but $2 \nmid 3$

$2, 8 \in A$
 $2 \leq 8 \Leftrightarrow 2 \mid 8$

(a) A is not an ordered subset of \mathbb{N} $x \leq y \Leftrightarrow x \mid y$
(b) A is an ordered subset of \mathbb{N}

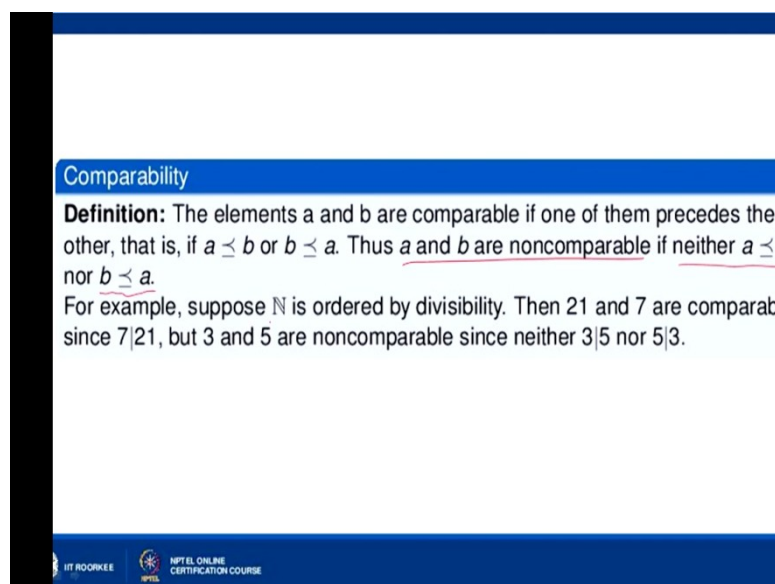

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

And therefore A is not an ordered subset of \mathbb{N} , Ok So this should happen for any two elements in A, Ok but we find two elements in A, 2, 3 for which $2 \leq 3$ but 2 does not divide 3. So this is not, not an ordered set, not an ordered subset of \mathbb{N} . Ok, now let us look at the second part $A = \{2, 4, 8, 32\}$. So what do you do? Suppose I take any two elements here, say

2, 4 or you can take 4, 8 or you can take 2, 8 Ok or you can take 8, 32 or you can take 4, 32 or 2, 32.

Then $x \leq y$, Ok. So let us take 2 and 8, Ok in A. Then $2 \leq 8$. And also $2 \mid 8$, Ok. So this is valid, Ok. 2 divides this if and only if this, this condition is valid there. Take any two elements, Ok. If x is, in A we are taking the usual notation, yeah usual order. So $x \leq y$ if and only if $x \mid y$. So this holds true in the case (b). So A is an ordered subset of y, ordered subset of N sorry, ordered subset of N.

(Refer Slide Time: 36:29)

The slide is titled "Comparability" and contains the following text:

Definition: The elements a and b are comparable if one of them precedes the other, that is, if $a \leq b$ or $b \leq a$. Thus a and b are noncomparable if neither $a \leq b$ nor $b \leq a$.

For example, suppose \mathbb{N} is ordered by divisibility. Then 21 and 7 are comparable since $7 \mid 21$, but 3 and 5 are noncomparable since neither $3 \mid 5$ nor $5 \mid 3$.

At the bottom of the slide, there are logos for IIT ROORKEE and NPTEL ONLINE CERTIFICATION COURSE.

Now we go to comparability. The elements a and b are called comparable if one of them precedes the other. That is $a \leq b$ or $b \leq a$, Ok. Thus a and b are non-comparable if neither $a \leq b$ nor $b \leq a$. For example, suppose \mathbb{N} is ordered by divisibility, Ok. Then 21 and 7 are comparable because $7 \mid 21$. But 3 and 5 are non-comparable because neither $3 \mid 5$ nor $5 \mid 3$.

(Refer Slide Time: 37:00)

Linearly ordered set

Definition: An ordered set S is said to be linearly or totally ordered, and S is called chain, if every pair of elements in S are comparable. For example, the positive integer \mathbb{N} with the usual order \leq is linearly ordered.

Example: Suppose \mathbb{N} is ordered by divisibility. State whether each of the following subsets of \mathbb{N} are linearly or totally ordered.:

(a) $A = \{7\}$ (b) $A = \{2, 4, 8, 32\}$ (c) $A = \{15, 5, 30\}$ (d) $\{1, 2, 3, \dots\}$ (e) $\{3, 15, 5\}$.

Linearly ordered set, an ordered set S is called linearly or totally ordered and S is called a chain if every pair of elements in S are comparable

(Refer Slide Time: 37:13)

Linearly ordered set

Definition: An ordered set S is said to be linearly or totally ordered, and S is called chain, if every pair of elements in S are comparable. For example, the positive integer \mathbb{N} with the usual order \leq is linearly ordered.

Example: Suppose \mathbb{N} is ordered by divisibility. State whether each of the following subsets of \mathbb{N} are linearly or totally ordered.:

(a) $A = \{7\}$ (b) $A = \{2, 4, 8, 32\}$ (c) $A = \{15, 5, 30\}$ (d) $\{1, 2, 3, \dots\}$ (e) $\{3, 15, 5\}$.

Ok so if you take a set S , Ok then you take any pair of elements in S , if they are comparable that is $a \leq b$ or $b \leq a$ happens then we say that S is totally ordered or linearly ordered. And the set S will be called as a chain. For example the positive integer, set of positive integers Ok, the set of positive integers with the usual order less than or equal to, linearly ordered. If you take any two elements in x, y in \mathbb{N} then either $x \leq y$ or $y \leq x$. So it is the usual order, the set of positive integers is a linearly ordered or totally ordered set. Now suppose \mathbb{N} is ordered by divisibility, Ok. Then we have to see whether the following subsets of \mathbb{N} are linearly or totally ordered, Ok.

(Refer Slide Time: 38:11)

Linearly ordered set

Definition: An ordered set S is said to be linearly or totally ordered, and S is called chain, if every pair of elements in S are comparable. For example, the positive integer \mathbb{N} with the usual order \leq is linearly ordered.

Example: Suppose \mathbb{N} is ordered by divisibility. State whether each of the following subsets of \mathbb{N} are linearly or totally ordered.:

(a) $A = \{7\}$ (b) $A = \{2, 4, 8, 32\}$ (c) $A = \{15, 5, 30\}$ (d) $\{1, 2, 3, \dots\}$ (e) $\{3, 15, 5\}$.

Handwritten notes: A: ✓ ✓ ✓
 $2, 3 \in A$ $3, 5$
neither $3|5$
nor $5|3$

So let us look at the set a consisting of a single element $\{7\}$. It consists of a single element 7 so it is totally ordered because there is only one element. So when you take a pair of elements it will be $\{7, 7\}$. So, $7 \mid 7$. So it is linearly or totally ordered set. Now here let us see $\{2, 4, 8, 32\}$, Ok. You take any two elements in this, Ok. $\{2, 4\}$ or $\{4, 2\}$ Ok. Then you take $\{4, 8\}$ or $\{8, 4\}$, $\{8, 32\}$ then either $4 \mid 8$ or 8 will divide, if you take 4, 8 then $4 \mid 8$. If you take, $\{8, 32\}$ then, $8 \mid 32$. If you take, $\{2, 32\}$, $2 \mid 32$. So if you take any pair of elements in a here in part b then one \mid the other, Ok.

Now here in the case of $\{15, 5, 30\}$ again if we take a pair, Ok then we find either the pair will be $\{15, 5\}$ or $\{5, 30\}$ or $\{15, 30\}$, there is always the situation that one element divides the other element. So this set and this set and this set are totally ordered or linearly ordered. If you take the entire set N , Ok entire set N , Ok then this N is not, this set is not linearly or totally ordered. Because if you take $\{1, 2\}$ Ok, if you take $\{1, 2\}$ then, if you take say $\{2, 3\}$, if you take $\{2, 3\}$ Ok in this set, let me call this set A , yes of course this A is equal to N .

So $\{2, 3\}$ you take in N , neither $2 \mid 3$ nor $3 \mid 2$. So this A is not linearly or totally ordered. If you take $\{3, 15, 5\}$, Ok, $\{3, 15, 5\}$ this is also not linearly or totally ordered because when we take $\{3, 5\}$ then neither $3 \mid 5$ nor $5 \mid 3$. So this set and this set are not totally or linearly ordered, Ok, So that is all in this lecture. Thank you very much for your attention.
