

An Introduction to Smooth Manifolds
Professor Harish Seshadri
Department of Mathematics
Indian Institute of Science Bengaluru
Lecture 15
Derivative of Smooth Maps

Hello and welcome to the 15th lecture in the series. So, in last class we talked about interpreting vectors in \mathbb{R}^n as derivations on C^∞ functions. Let us see how this can be used to define the tangent space of a manifold.

(Refer Slide Time: 0:49)

So, we begin with so let me state the, give the definition straight away. But it will not be clear in the beginning that we will get a finite dimensional vector space, so you have to do a bit more work. The tangent space to a manifold. So let M be a n manifold and let P be a point on M . We define $T_P M$, the tangent space to M at the point P to be the set equal to set of all derivations on $C^\infty M$ i.e. $T_P M$ equal to set of all T , set of all linear maps from $C^\infty M$ to \mathbb{R} satisfying the Leibnitz rule at P . Note that $T_P M$ a vector space.

In other words, if I have, if T_1 rather let us see a different notation for elements of $T_P M$. So if v and w belong to $T_P M$ then and C_1, C_2 belongs a real numbers then $C_1 v$ plus $C_2 w$ is also an element of $T_P M$ i.e. $C_1 v$ plus $C_2 w$ is a linear map from $C^\infty M$ to \mathbb{R} and a derivation. This is immediate from the defining property of a derivation after all. What do we have to check? The linearity is clear enough. If you have two linear maps, then their linear combination is also a linear map. And checking that it is a derivation is not any harder.

(Refer Slide Time: 4:36)

$$\begin{aligned} & [(C_1 v + C_2 w)(fg)] \\ & \stackrel{?}{=} \frac{f(P)(C_1 v + C_2 w)(g) + g(P)(C_1 v + C_2 w)(f)}{} \\ \text{L. H.S.} &= C_1 v(fg) + C_2 w(fg) \\ &= C_1 [f(P)v(g) + g(P)v(f)] \\ &+ C_2 [f(P)w(g) + g(P)w(f)] \\ &= f(P)(C_1 v(g) + C_2 w(g)) + g(P)(C_1 v(f) + C_2 w(f)) \end{aligned}$$

Then: $\dim T_p M = n.$

The tangent space to a manifold: Let M be a n -manifold and let $p \in M$.
 we define $T_p M =$ set of all derivations on $C^\infty(M)$.
 i.e. $T_p M = \left\{ \begin{array}{l} \text{linear map from } C^\infty(M) \text{ to } \mathbb{R} \\ \text{satisfying the Leibnitz rule at } p \end{array} \right\}$

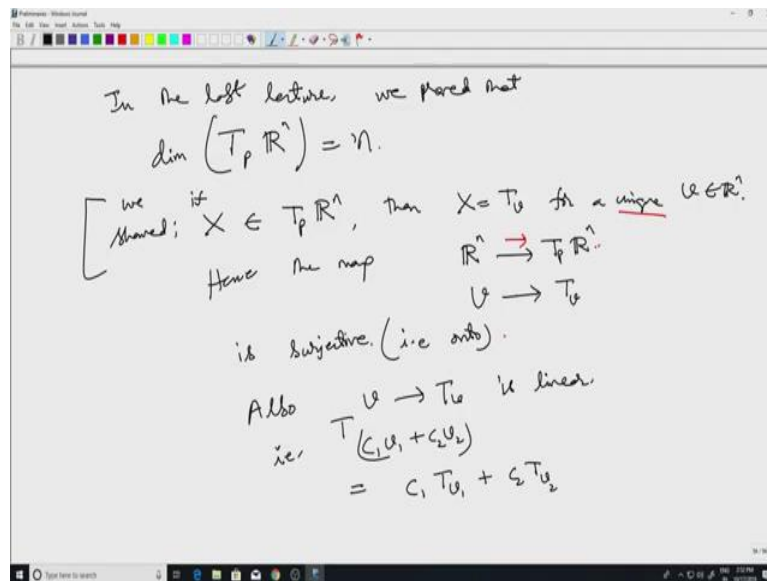

Note that $T_p M$ is a vector space:
 if $v, w \in T_p M$ and $C_1, C_2 \in \mathbb{R}$
 then $C_1 v + C_2 w \in T_p M$
 i.e. $C_1 v + C_2 w$ is a linear map from $C^\infty(M)$ to \mathbb{R} + a derivation

So just a matter of saying that $C_1 v$ plus $C_2 w$ suppose I want to check it is a derivation. All I have to do is act it on a product of two functions fg . Then I want to know whether this is equal to $C_1 v$ plus $C_2 w$. This is equal to f of P times $C_1 v$ plus $C_2 w$ of g plus g of P , $C_1 v$ plus $C_2 w$ of f . And the way to see it is just start with the left hand side $C_1 v$ plus $C_2 w$ acting on fg is, by definition it is equal to $C_1 v$ acting on fg plus $C_2 w$ acting on fg . Now just use the derivation property for v and w . So I will get C_1 times f of P , v of g plus g of P , oops so I should change it slightly g of P and then I have f of v .

Similarly, the second term is f of P w of g plus g of P w of f . Then I just combine the corresponding terms. So if I combine the, so I will combine this and this and I will combine this and this along with the C_1 and C_2 . So I will end up getting f of P times $C_1 v$ of g plus C_2

W of g plus g of P times C1 v of f plus C2 W of f which is essentially what I want here. So this is what I wanted and that is what I have here. So it is quite straightforward to check that it is indeed a derivation. So the point is that TPM was a vector space. However, it is one has to still so what one would expect is that it is actually just again an n dimensional vector space since we are dealing with the n manifold and that is the theorem. So, let state it as a theorem that it has dimension n.

(Refer Slide Time: 8:32)

Now, what we have proved is that in the last lecture what we proved the last lecture we proved that TP, \mathbb{R}^n when the manifold is \mathbb{R}^n itself. I did not stated in these terms. But what I did was in the last lecture I showed that if we start with any derivation v on \mathbb{R}^n , with the our new notation, a derivation on \mathbb{R}^n would be an element of $TP \mathbb{R}^n$. So that what I am starting with, we showed if v belongs to this, actually the notation is becoming a bit inconsistent.

So let instead of v , let us say as we showed that, if x belongs to this, then x equals Tv for a unique v in \mathbb{R}^n so, this gives us, this enables us to set up an isomorphism between \mathbb{R}^n and $TP \mathbb{R}^n$, hence the map from \mathbb{R}^n to $TP \mathbb{R}^n$ given by v going to Tv is this map is surjective i.e. onto. So, since the previous statement says that if you start with any derivation here in the space so an element of the space is a derivation, if I start with in derivation it can be written as Tv for some v . So, that means precisely that this map here is onto, this map is onto. And not only that, it is we also seen that this map is injective that follows from the uniqueness of this.

So, two different vectors cannot go to the same derivation. So, because we have seen that, if Tv equals Tw , then v has to be equal to w . So, in other words, this map is a bijection but not only is it a bijection this map is also linear also v going to Tv is linear and this is i.e., what does this amount to $C_1 v_1 + C_2 v_2$ the directional derivative along this linear combination is equal to $C_1 T v_1 + C_2 T v_2$. And this is again immediately clear from the definition of the directional derivative. This is not so clear from the, rather than using the definition.

(Refer Slide Time: 12:51)

$$T_v(f) = \frac{d}{dt} f(p + tv) \Big|_{t=0} = \boxed{df_p(v)}$$

$$T_{c_1 v_1 + c_2 v_2}(f) = \frac{d}{dt} f(p + t(c_1 v_1 + c_2 v_2)) \Big|_{t=0}$$

$$T_{c_1 v_1 + c_2 v_2}(f) = df_p(c_1 v_1 + c_2 v_2)$$

$$= c_1 df_p(v_1) + c_2 df_p(v_2)$$

$$= c_1 T_{v_1}(f) + c_2 T_{v_2}(f)$$

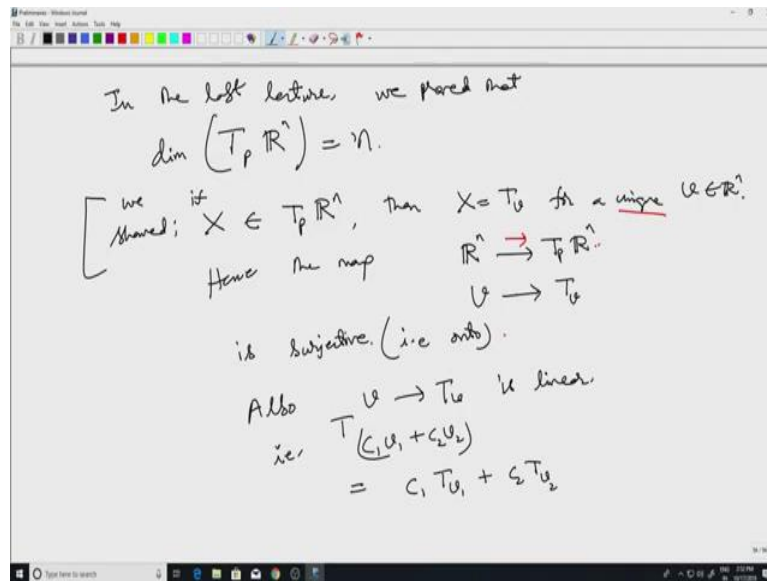

$$+ c_2 \left(f'(v) \omega(v) + \dots \right) + \dots$$

$$= f'(p) (c_1 v_1 + c_2 v_2) + \dots$$

Theorem: $\dim T_p M = n.$

In the last lecture, we proved that $\dim(T_p \mathbb{R}^n) = n.$

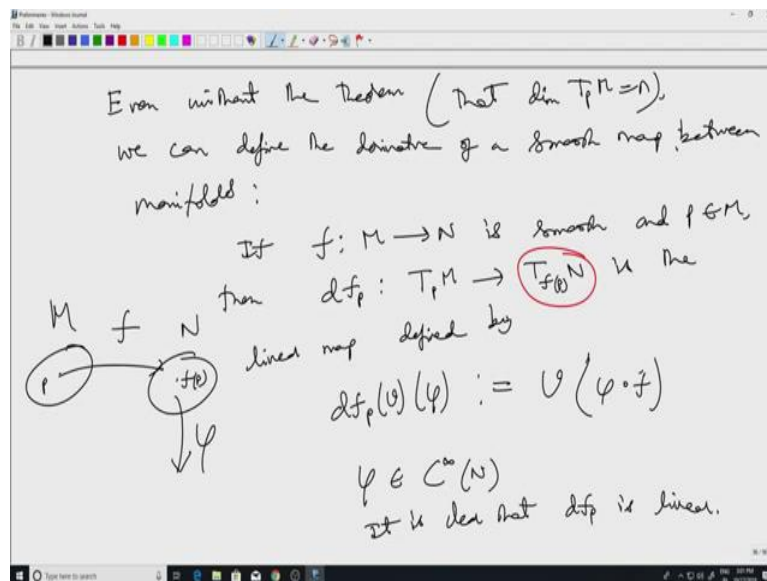

[we showed: if $X \in T_p \mathbb{R}^n$, then $X = T_v$ for a unique $v \in \mathbb{R}^n$.
Hence the map $\mathbb{R}^n \rightarrow T_p \mathbb{R}^n$
 $v \rightarrow T_v$

If you use the definition, then $T_v f$ is d by dt of f of P plus T_v at t equals to 0. But if you use this, it is not immediately clear that if I put $C_1 v_1$, f of P plus t times $C_1 v_1$ plus $C_2 v_2$, this is what I would get. But then it is not immediately clear that this I can write it as something involving I can bring out the C_1 outside etcetera. Rather than use this I would, it is easier to see if I (use), we know that this is the same thing as df_P of v if I take this, it is immediately clear because after all df_P is a linear map therefore when I put this, then I just get this and, one would be done. This is the same thing as $C_1 T v_1$ of f $C_2 T v_2$ of f this was $T C_1 v_1$ plus $C_2 v_2$ of f . So, using this expression here makes the linear dependence on v immediately clear.

While if I use the definition it is not immediately clear one has to go one or two steps ahead. Now so, to summarize, we are we want to prove that the dimension of the space of derivations on C^∞ functions on a manifold is n . And what we have proved in the last lecture is that the space of derivations on \mathbb{R}^n or other on $C^\infty \mathbb{R}^n$ has dimension n . So, how does one use this fact about \mathbb{R}^n to get information about the whole manifold? So, there is a key missing ingredient here, which I will now talk about. Yeah, right. This is the so called local property of derivations, but before I come to that, perhaps even without knowing that this, this is dimension of $T_p M$ is n or even finite dimensional, I can still bring in the notion of a derivative of a smooth map.

(Refer Slide Time: 16:22)

So, even without the theorem that dimension of $T_p M$ is equal to n , we can define the derivative of a smooth map between manifolds. In the (case), then when we started this course, we started by defining the derivative of a smooth map between open sets and Euclidean spaces is a linear map between \mathbb{R}^n and \mathbb{R}^m . But now what we are going to do is we are going to replace the \mathbb{R}^n and \mathbb{R}^m by this notion of a tangent space. So for us if f from M to N is smooth and p belongs to M then df_p is going to be a map from the tangent space to M at P to the tangent space at f of P . And this is the linear map defined by.

So, df_p at, the input is a vector in element of $T_p M$. However, an element of $T_p M$ itself is a certain linear map on a different vector space namely C^∞ functions on M . So, now I am supposed to get df_p of v is supposed to be an element of this space. So in other words, it is going to be a linear map on C^∞ functions on N , which is a derivation at f of P . So it has to act on some C^∞ function on N . So let us call that φ . So, where, here φ is, so the picture is like this $M \rightarrow N$ f is a map, P is a point here $f(P)$ is a point here. φ is a C^∞ function on N , and df_p of v is going to act on that.

And my definition of this is going to be just I will use the v . So v , let us think derivation on this side. I am going to compose f and φ . So I will get a function C^∞ function on M . $\varphi \circ f$ composed with f . So, this is my definition of the derivative. And one thing is certainly clear immediately from the definition that this association this is linear in v . It is clear that the df_p is linear.

(Refer Slide Time: 20:51)

ie. if $c_1, c_2 \in \mathbb{R}$,

$$\text{Then } df_p(c_1 v_1 + c_2 v_2) = c_1 df_p(v_1) + c_2 df_p(v_2)$$

$$\Leftrightarrow \text{for any } \varphi \in C^\infty(N)$$

$$df_p(c_1 v_1 + c_2 v_2)(\varphi)$$

$$= c_1 df_p(v_1)(\varphi) + c_2 df_p(v_2)(\varphi)$$

Note that we have used the following fact:
 Compositions of smooth maps between manifolds are smooth.

we can define the derivative of a smooth map between manifolds:

If $f: M \rightarrow N$ is smooth and $p \in M$,
 then $df_p: T_p M \rightarrow T_p N$ is the
 linear map defined by

$$df_p(v)(\varphi) := v(\varphi \circ f)$$

$\varphi \in C^\infty(N)$
 It is clear that df_p is linear.

ie. if $c_1, c_2 \in \mathbb{R}$,

So again what does it mean to say that this is linear i.e., if C_1, C_2 belong to \mathbb{R} then df_p of $C_1 v_1 + C_2 v_2$ where $C_1 df_p v_1 + C_2 df_p v_2$ and what in turn I mean this is still this is clear enough, but what this really means is that this, that this equal to this amounts to saying that for any φ in $C^\infty(N)$, the left hand side acting on this φ is equal to right hand side acting on φ . So this entire thing acting on φ should be equal to $C_1 df_p v_1$ acting on φ plus $C_2 df_p v_2$ acting on φ , at this point everything is just a number, the left hand side is a real number right hand side is a real number.

So, at this point, we just go back to this equation here and then everything becomes immediately clear because after all the left hand side is $C_1 v_1 + C_2 v_2$ so, I would end up

instead of this v I would end up plugging in this thing here and so, the action of $C1 v1$ plus $C2 v2$ on this function and then just split it up and so on. So, that is it, but there is one small issue in what in this definition, namely that I implicitly used a certain fact. So, I had a smooth function ϕ from N to R , and f was a smooth function from M to N . I took the composition and got a function from M to R , which is this ϕ composed with f . But in order to act v on that, I need to know that this is still this composition is smooth.

In other words, note that we have used the following fact which I did not prove or even state because I will need to state it again when I talk about chain rule. So I will return to this, but let me just mention it here compositions of smooth maps between manifolds are smooth. So that is this ϕ composed with f , that I used to say that that is smooth it is, I have used this fact. But given that, it is clear that so we do have a notion of a derivative. It is defined in a very abstract but abstract way, from the way it is defined here, it is not, at first sight it is not clear where derivatives are involved at all.

Of course, if one keep remembers that vZ derivation. And we know that derivations of somehow are essentially given by derivatives, then it is clear that and I will be differentiating this ϕ as well ϕ and f both. So if one keeps the recalls that then it is clear that derivatives of ϕ will come into play. But that is in a somewhat vague sense, but more precisely, one would like to claim that this notion of derivative is equal interval earlier notion of derivative when we go back to R^n .

This notion the point is that this note notion of derivative or differential of a smooth map makes sense on a manifold while earlier notion of derivative of course is which involved taking ratios and norms of things and so on, so that absolutely does not make sense. This abstract definition makes sense, but we want to check that it coincides with earlier definition. So I will talk about that in the next lecture. So we will stop here. Thank you.
