**Flow Through Elliptical Duct**

Hello everyone. So, in today's lecture we will find the velocity profile for Poiseuille flow inside elliptical duct with uniform cross section. We will consider infinitely long elliptical duct and pressure gradient is constant with negligible gravitational acceleration and also we will consider fully developed flow.

In this case we have already derived the governing equation. So, we will start with that equation and in this particular case we will find the velocity profile or we will assume the velocity profile such a way that it will satisfy the no slip condition at the wall.

(Refer Slide Time: 01:20)

### Flow Through Elliptical Duct

Laminar steady incompressible Newtonian fluid flow.  
 Flow is fully developed.  
 Pressure gradient is constant in the direction of flow.  
 Gravity effect is negligible.  
 Constant cross-sectional duct.

Governing equation:  

$$\frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = \frac{1}{\mu} \frac{\partial p}{\partial x} \quad u = u(y, z)$$

Equation of Ellipse,  

$$\frac{y^2}{a^2} + \frac{z^2}{b^2} = 1$$

$$1 - \frac{y^2}{a^2} - \frac{z^2}{b^2} = 0$$

We'll assume the velocity profile as  

$$u(y, z) = A \left( 1 - \frac{y^2}{a^2} - \frac{z^2}{b^2} \right)$$
 Boundary Condition,  $u = 0$  on  $\frac{y^2}{a^2} + \frac{z^2}{b^2} = 1$

So, consider this elliptical duct where x is the axial direction, this is the y direction and this is the z direction. So, if you take any particular cross section then you will get this is the elliptical duct with uniform cross section where this is the z direction, this is the y direction, this is the major axis and this is the minor axis. So, obviously, for this particular case we know the governing equation is this one where  $\frac{\partial p}{\partial x}$  is a constant in the direction of flow and u is function of y and z right.

So, now we will try to find the velocity profile from the just assuming a velocity profile. So, let us consider the elliptical this duct for this wall what is the equation? We will consider first the equation of ellipse ok. So, you know for this particular case or particular geometry you can have the equation of ellipse as  $y^2/a^2 + z^2/b^2 = 1$  or we can write  $1 - y^2/a^2 - z^2/b^2 = 0$ .

So, this is the equation for this wall ok. So,  $1 - \frac{y^2}{a^2} - \frac{z^2}{b^2} = 0$ . So, we will assume the velocity profile inside this domain as some constant into this equation of ellipse then automatically the no slip condition will be satisfied at the wall for this velocity profile. So, we will assume the velocity profile as  $u$  which is function of  $z$  and  $y$  is equal to some constant into the equation of ellipse  $1 - \frac{y^2}{a^2} - \frac{z^2}{b^2} = 0$  ok.

So, from here you can see that the velocity profile clearly satisfies no slip condition at the tube walls because this term becomes 0 right at the wall and boundary condition. So, you can see that  $u$  will be 0 which is your no slip condition on the wall and this is valid when  $\frac{y^2}{a^2} + \frac{z^2}{b^2} \leq 1$  because this is actually inside the domain and when equal to 1 this will become boundary condition. Now, we will determine this constant  $a$  just satisfying the governing equation ok.

(Refer Slide Time: 05:15)

### Flow Through Elliptical Duct

G.E  $\frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = \frac{1}{\mu} \frac{\partial p}{\partial x}$

$u(y,z) = A \left( 1 - \frac{y^2}{a^2} - \frac{z^2}{b^2} \right) \leftarrow$

$\frac{\partial u}{\partial y} = A \left( -\frac{2y}{a^2} \right)$

$\frac{\partial^2 u}{\partial y^2} = -\frac{2A}{a^2}$

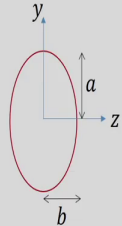

$\frac{\partial u}{\partial z} = A \left( -\frac{2z}{b^2} \right)$

$\frac{\partial^2 u}{\partial z^2} = -\frac{2A}{b^2} \leftarrow$

$\frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = \frac{1}{\mu} \frac{\partial p}{\partial x}$

$-\frac{2A}{a^2} - \frac{2A}{b^2} = \frac{1}{\mu} \frac{\partial p}{\partial x}$

$\Rightarrow A = \frac{1}{2\mu} \left( -\frac{\partial p}{\partial x} \right) \frac{a^2 b^2}{a^2 + b^2}$

So, we know the governing equation as  $\frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = \frac{1}{\mu} \frac{\partial p}{\partial x}$ . So, now, we have assumed the velocity profile as  $A \left( 1 - \frac{y^2}{a^2} - \frac{z^2}{b^2} \right)$ . So, you find the derivative ok. So, you can see from here you can see  $\frac{\partial u}{\partial y}$  it will be just  $A \left( -\frac{2y}{a^2} \right)$  and if you write  $\frac{\partial^2 u}{\partial y^2}$  then it will become  $-\frac{2A}{a^2}$ .

Similarly, you can see the derivative  $\frac{\partial u}{\partial z}$  you can write as  $A \left( -\frac{2z}{b^2} \right)$  and  $\frac{\partial^2 u}{\partial z^2}$  is equal to  $-\frac{2A}{b^2}$  ok. Now you satisfy these derivatives in the governing equation and let us find the constant  $A$ . So, now, let us write in the governing equation  $\frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = \frac{1}{\mu} \frac{\partial p}{\partial x}$ .

So,  $\frac{\partial^2 u}{\partial y^2}$  is minus  $2A$  by  $a^2$  and  $\frac{\partial^2 u}{\partial z^2}$  is minus  $2A$  by  $b^2$  is equal to  $\frac{1}{2\mu} \left(-\frac{\partial p}{\partial x}\right)$ . So, you can see from here it will be  $A$  is equal to  $\frac{1}{2\mu} \left(-\frac{\partial p}{\partial x}\right) \frac{a^2 b^2}{a^2 + b^2}$  ok. So, now, we know the constant  $A$ , we know the velocity profile. So, if you put the value of  $A$  here. So, we will get the velocity profile inside the elliptical duct.

(Refer Slide Time: 07:42)

**Flow Through Elliptical Duct**

The velocity profile,

$$u(x, y, z) = \frac{1}{2\mu} \left(-\frac{\partial p}{\partial x}\right) \frac{a^2 b^2}{a^2 + b^2} \left(1 - \frac{y^2}{a^2} - \frac{z^2}{b^2}\right)$$

Maximum velocity,

$$u_{\max} = u(x, y, z) \Big|_{\substack{y=0 \\ z=0}} = \frac{1}{2\mu} \left(-\frac{\partial p}{\partial x}\right) \frac{a^2 b^2}{a^2 + b^2}$$

$$u(x, y, z) = u_{\max} \left(1 - \frac{y^2}{a^2} - \frac{z^2}{b^2}\right)$$

So, the velocity profile ok. So, if you put the value of  $a$  here you will get  $u$  as  $\frac{1}{2\mu} \left(-\frac{\partial p}{\partial x}\right) \frac{a^2 b^2}{a^2 + b^2}$  we will write minus  $\frac{\partial p}{\partial x}$  because this is the favorable pressure gradient, it will be positive we have  $a^2$  by  $a^2 + b^2$  and  $1 - \frac{y^2}{a^2} - \frac{z^2}{b^2}$ . So, this is the velocity profile inside the elliptical duct with uniform cross section, now if you want to find the maximum velocity where it is occur ok.

So, maximum velocity obviously, it will occur you can see that it will occur at the origin where  $y$  is equal to 0 and  $z$  equal to 0. So, from the symmetrical geometry and the boundary condition you can tell that ok. So, if you put  $z$  is equal to 0 and  $y$  is equal to 0 then you will get the maximum velocity at the center line ok. Let us find the maximum velocity. So, maximum velocity ok. So, you will get  $u_{\max}$ . So, where it will occur? Obviously, where ever we have taken the origin; that means,  $u$  at  $z$  is equal to 0 and  $y$  is equal to 0 at the centre line.

So, at the center line now if you put here  $z$  is equal to 0  $y$  is equal to 0. So, you will get just  $1$  by twice  $\mu$  minus  $\Delta p$  by  $\Delta x$   $a^2 b^2$  by  $a^2 + b^2$ . So, this is the maximum velocity and you can write this velocity profile in terms of  $u_{\max}$  as  $u$   $z$   $y$  is equal to. So, this first part you can see this will be just  $u_{\max}$  into  $1 - \frac{y^2}{a^2} - \frac{z^2}{b^2}$ . Now first let us calculate the volumetric flow rate inside this elliptical duct and from there we will find the average velocity.

So, to find the volumetric flow rate inside this elliptical duct, we will consider this one quarter of this domain. So, you can see.

(Refer Slide Time: 10:33)

### Flow Through Elliptical Duct

The volumetric flow rate through Elliptical duct:

$$Q = \int_A u(z,y) dA$$

$$= 4 \int_0^b \int_0^{a\sqrt{1-\frac{z^2}{b^2}}} u_{max} \left(1 - \frac{y^2}{a^2} - \frac{z^2}{b^2}\right) dy dz$$

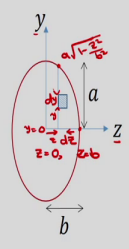

$$= 4 u_{max} \int_0^b \left\{ \int_0^{a\sqrt{1-\frac{z^2}{b^2}}} \left(1 - \frac{y^2}{a^2} - \frac{z^2}{b^2}\right) dy \right\} dz$$

$$= 4 u_{max} \int_0^b \left[ y - \frac{y^3}{3a^2} - \frac{z^2 y}{b^2} \right]_0^{a\sqrt{1-\frac{z^2}{b^2}}} dz$$

$$= 4 u_{max} \int_0^b \left[ a\sqrt{1-\frac{z^2}{b^2}} - \frac{a^3}{3a^2} \left(1-\frac{z^2}{b^2}\right)^{3/2} - \frac{z^2 a}{b^2} \left(1-\frac{z^2}{b^2}\right)^{3/2} \right] dz$$

$$= \frac{4}{3} a u_{max} \int_0^b \left(1-\frac{z^2}{b^2}\right)^{3/2} dz$$

$dA = dy dz$   
 $\frac{y^2}{a^2} + \frac{z^2}{b^2} = 1$   
 $dy = a \sqrt{1-\frac{z^2}{b^2}}$

Ah If you see it is actually one fourth of the domain, if we can find the volumetric flow rate and if we multiply with 4, then we will get the total volumetric flow rate inside the elliptical duct ok. So, what we will do? We are considering this right top this part and this is the z this is the y and at a particular distance z let us take one elemental area of a distance d z.

Similarly, at a distance y you take one a small strip of length d y. So, you can see this elemental area is d y d z ok. So, d A is d y into d z ok. So, now, if you integrate this area over this one quarter of this elliptical duct, then you will get the total area and now let us find the volumetric flow rate for this one quarter as Q is equal to; obviously, it is area integral u which is function of z y d A right. So, now, area integral. So, this is the small elemental area we have considered.

So, now you can see that if you vary  $z$  is equal to 0 to  $z$  is equal to  $b$  at this point  $z$  is equal to  $b$  then at a particular location  $z$  you can see  $y$  will vary ok. So, how it will vary. So, that we can find from the equation of ellipse. So, you can see here that equation of ellipse is  $y^2$  plus  $z^2$  by  $b^2$  is equal to 1. So, from here you can see  $y$  as a root  $1$  minus  $z^2$  by  $b^2$ . So, you can see at a particular  $z$  you will have the  $y$  as a root  $1$  minus  $z^2$  by  $b^2$  and this  $y$  will vary with  $z$  ok.

So, now, we will write the integral. So, now, we are multiplying by 4 because whatever volumetric flow rate we are calculating in the one fourth of the domain. So, we are multiplying with 4 now we will integrate 0 to  $b$  first in  $z$  direction. So, now, in  $y$  direction now we will have from  $y$  is equal to 0 to  $y$  is equal to this ok. So, we will get 0 to a root  $1$  minus  $z^2$  by  $b^2$  ok.

Now, we have the expression of the  $u$   $z$   $y$  as  $u_{max}$   $u_{max}$  is constant  $1 - y^2$  by  $a^2$  minus  $z^2$  by  $b^2$  into  $dy dz$  ok. First we will integrate with respect to  $y$  then we will integrate with respect  $z$  ok. So, first let us evaluate this term ok. So, we will can write  $4 u_{max}$  outside the integral 0 to  $b$ . So, first we will evaluate this integral. 0 to a root  $1$  minus  $z^2$  by  $b^2$   $1 - y^2$  by  $a^2$  minus  $z^2$  by  $b^2$   $dy$  then after that we will integrate this term with respect to  $z$  ok.

So, first let us evaluate the integral inside the curly bracket. So, we can see. So, 0 to a root  $1$  minus  $z^2$  by  $b^2$   $1 - y^2$  by  $a^2$  minus  $z^2$  by  $b^2$   $dy$  this first let us evaluate.

So, you can see if you integrate it, it will be  $y$  minus  $y^3$  by 3  $a^2$  minus  $z^2$  by  $b^2$   $y$  limit 0 to a root  $1$  minus  $z^2$  by  $b^2$  ok. So, you can see that if we take  $y$  common from this two terms then we can write it as  $y$   $1 - z^2$  by  $b^2$  and we have minus  $y^3$  by 3  $a^2$  limit 0 to a root  $1$  minus  $z^2$  by  $b^2$ .

So, now, if you put the value of  $y$  is equal to 0 so; obviously, it will become 0. So,  $y$  is equal to just a root  $1$  minus  $z^2$  by  $b^2$  you just write. So, you will get. So,  $y$  if you put.

So, it will be 1 minus z square b square to the power half and here 1 is there. So, 1 plus half will be 3 by 2. So, you can write a 1 minus z square by b square to the power 3 by 2 ok.

And minus so, you can see here y cube. So, it will be a cube by 3 a square and it is 1 minus z square by b square to the power half. So, it will be 3 by 2. So, 1 minus z square by b square to the power 3 by 2. So, this 1 a will be here and you can see from here. So, it will be a by 3 and a; that means, it will be 2 by 3 right. So, it will be 2 by 3 a 1 minus z square by b square to the power 3 by 2. So, now we can see that we have evaluated this term which is 2 by 3 a 1 minus z square by b square to the power 3 by 2. So, let us put it here and again integrate it.

(Refer Slide Time: 17:13)

**Flow Through Elliptical Duct**

$$Q = 4 u_{max} \frac{2a}{3} \int_0^b \left(1 - \frac{z^2}{b^2}\right)^{3/2} dz$$

$$I = \int_0^b \left(1 - \frac{z^2}{b^2}\right)^{3/2} dz \leftarrow$$

Let  $z = b \sin \theta$   
 $dz = b \cos \theta d\theta$   
 $1 - \frac{z^2}{b^2} = 1 - \sin^2 \theta = \cos^2 \theta$

@  $z=0, \theta=0$   
@  $z=b, \theta = \frac{\pi}{2}$

$$I = \int_0^{\pi/2} (\cos^2 \theta)^{3/2} b \cos \theta d\theta = b \int_0^{\pi/2} \cos^4 \theta d\theta$$

Let  $z = b \cos \theta$   
 $dz = b (-\sin \theta) d\theta$   
@  $z=0, \theta = \pi/2$  @  $z=b, \theta=0$

$$I = \int_{\pi/2}^0 (\sin^2 \theta)^{3/2} b (-\sin \theta) d\theta = b \int_0^{\pi/2} \sin^4 \theta d\theta$$

$$2I = b \int_0^{\pi/2} (\cos^4 \theta + \sin^4 \theta) d\theta$$

$1 - \frac{z^2}{b^2} = 1 - \cos^2 \theta = \sin^2 \theta$

So, now we got Q as 4 u max twice a by 3 integral 0 to b 1 minus z square by b square 3 by 2 d z. Now let us integrate this term ok. So, just we will show the derivation now we need to

evaluate this term  $0$  to  $b \sqrt{1 - z^2}$  by  $b^2$  to the power  $3/2$   $dz$  ok. First we will just take let  $z$  is equal to  $b \sin \theta$  ok.

So, if  $z$  is equal to  $b \sin \theta$  then we can write  $dz$  is equal to  $b \cos \theta d\theta$ , now if you put here you can see  $1 - z^2$  by  $b^2$  will be just  $1 - \sin^2 \theta$ . So, it will be  $\cos^2 \theta$ . Now let us discuss about the limit ok. So, you can see at  $z$  is equal to  $0$  so, obviously, you can see that  $\theta$  will be  $0$  because  $\sin \theta$  is  $0$  and at  $z$  is equal to  $b$  ok. So,  $\sin \theta$  is  $1$ . So, if  $\sin \theta$  is  $1$  then  $\theta$  is equal to  $\pi/2$  ok.

So, now if we say that the integral is  $I$ , then you can write  $I$  is equal to integral  $0$  to  $\pi/2$ . So, in terms of  $\theta$  we are writing the limit  $\cos^2 \theta$  to the power  $3/2$  and  $dz$  is  $b \cos \theta d\theta$  ok. So, this you can write as  $0$  to  $\pi/2$  and  $b$  is constant you can write outside the integral and here it be  $\cos^3 \theta$  and  $\cos \theta$ . So, it will be  $\cos^4 \theta d\theta$  and again let us write that  $z$  is equal to  $b \cos \theta$  ok.

So, if  $z$  is equal to  $b \cos \theta$  then we can find  $dz$  is equal to  $-b \sin \theta d\theta$  and if you see the limit at  $z$  is equal to  $0$  so; obviously,  $\cos \theta$  is equal to  $0$  and  $\cos \theta$  is equal to  $0$  means  $\theta$  will be  $\pi/2$  and at  $z$  is equal to  $b$  obviously,  $\cos \theta$  is  $1$  so,  $\theta$  will be  $0$ . So, this integral now we can write this integral if you put these values again we can write that  $I$  is equal to  $\pi/2$  to  $0$  and  $1 - z^2$  by  $b^2$ . So, it will become  $1 - \cos^2 \theta$  so; that means, it is  $\sin^2 \theta$  ok.

So, we will get  $\sin^2 \theta$  to the power  $3/2$  and this will get  $b \sin \theta d\theta$  ok. So, here one minus sin is there and integral  $\pi/2$  to  $0$  there. So, now, we will just change the limit from  $0$  to  $\pi/2$ . So, this minus sin will not be there. So, we will get now  $\sin^2 \theta$  to the power  $4/2$ ,  $d\theta$  and  $b$  will be there outside the integral. So, what we will do now just we will add these two. So, if we add these two then we will get  $2I$  is equal to  $0$  to  $\pi/2$  and we have  $\cos^4 \theta + \sin^4 \theta d\theta$ .

(Refer Slide Time: 21:38)

Flow Through Elliptical Duct

$$2I = b \int_0^{\pi/2} (\cos^4 \theta + \sin^4 \theta) d\theta$$

$$(\cos^2 \theta + \sin^2 \theta)^2 = \cos^4 \theta + 2 \sin^2 \theta \cos^2 \theta + \sin^4 \theta$$

$$\cos^4 \theta + \sin^4 \theta = (\cos^2 \theta + \sin^2 \theta)^2 - 2 \sin^2 \theta \cos^2 \theta$$

$$= 1 - \frac{1}{2} (2 \sin \theta \cos \theta)^2$$

$$= 1 - \frac{1}{2} \sin^2 2\theta$$

$$= 1 - \frac{1}{4} (1 + \cos 4\theta)$$

$$= 1 - \frac{1}{4} - \frac{1}{4} \cos 4\theta$$

$$= \frac{3}{4} - \frac{1}{4} \cos 4\theta$$

$$2I = \frac{b}{4} \int_0^{\pi/2} (3 - \cos 4\theta) d\theta$$

$$= \frac{b}{4} \left[ 3\theta - \frac{\sin 4\theta}{4} \right]_0^{\pi/2}$$

$$= \frac{b}{4} \cdot 3 \frac{\pi}{2} = \frac{3\pi b}{8}$$

$$\therefore I = \frac{3\pi b}{16}$$

Now, let us find the integral. So,  $2I$  we can write as  $b \int_0^{\pi/2} (\cos^4 \theta + \sin^4 \theta) d\theta$ . So, this term you can see we can write as  $\cos^4 \theta + \sin^4 \theta$  whole square we can write as  $(\cos^2 \theta + \sin^2 \theta)^2 - 2 \sin^2 \theta \cos^2 \theta$  ok. So, you can see from here we can write  $\cos^4 \theta + \sin^4 \theta$  is equal to  $1 - 2 \sin^2 \theta \cos^2 \theta$ . So,  $\cos^4 \theta + \sin^4 \theta$  whole square minus  $2 \sin^2 \theta \cos^2 \theta$ .

What is the value of this term? Right hand side first term. So, it is 1 right. So, we will get 1 and what we will do here? We will write just half  $2 \sin \theta \cos \theta$  square. So, now, we know that  $2 \sin \theta \cos \theta$  is  $\sin 2\theta$ . So, we can write  $1 - \frac{1}{2} \sin^2 2\theta$  and now we can again write that  $1 - \frac{1}{4} (1 + \cos 4\theta)$  ok. Now  $2 \sin^2 \theta$  is  $1 - \cos 4\theta$  ok.

So, it will be  $1 - \frac{1}{4} - \frac{1}{4} \cos 4\theta$ . So, it will be  $\frac{3}{4} - \frac{1}{4} \cos 4\theta$  ok. So, now, let us put it here and integrate it. So, we will get  $2I$  is equal to  $b^4 \int_0^{\pi/2} (1 - \frac{1}{4} - \frac{1}{4} \cos 4\theta) d\theta$ .

So, we will get  $3\theta - \frac{\sin 4\theta}{4}$  it will be  $b^4 \int_0^{\pi/2} (1 - \frac{1}{4} - \frac{1}{4} \cos 4\theta) d\theta$ . So, we can see it will be  $3\theta - \frac{\sin 4\theta}{4}$  by  $4$  from  $0$  to  $\pi/2$ . So, we can see here that for  $\theta$  is equal to  $0$ ; obviously, first term will become  $0$ ,  $\sin 0$  will be  $0$  and if you put  $\theta$  is equal to  $\pi/2$ . So, this will become  $\sin 2\pi$  and  $\sin 2\pi$  value is  $0$ .

So, second term will be  $0$ . So, we can write  $b^4 \frac{3\pi}{2}$  ok. So, this will be just  $\frac{3\pi b^4}{8}$ . So, now, we have found the integral  $I$  which actually we wanted to find. So, that is  $\frac{3\pi b^4}{16}$ . So, now, we have found the integral  $I$ . So, now, if we put this value in the expression of volumetric flow rate, then we can find the volumetric flow rate of inside elliptical duct.

(Refer Slide Time: 25:11)

**Flow Through Elliptical Duct**

$$Q = \int u_{max} \frac{2a}{3} \frac{3\pi b}{16a^2}$$

$$Q = \frac{\pi}{2} u_{max} ab$$

Volumetric flow rate,

$$Q = \frac{\pi}{2} \frac{1}{2\mu} \left(-\frac{\partial P}{\partial x}\right) \frac{a^2 b^2}{a^2 + b^2} ab$$

$$Q = \frac{\pi}{4\mu} \left(-\frac{\partial P}{\partial x}\right) \frac{a^3 b^3}{a^2 + b^2}$$

$$Q = A u_{avg} \quad A = \pi ab$$

$$u_{avg} = \frac{\pi}{4\mu} \cdot \frac{1}{\pi ab} \left(-\frac{\partial P}{\partial x}\right) \frac{a^3 b^3}{a^2 + b^2}$$

Average velocity,

$$u_{avg} = \frac{1}{4\mu} \left(-\frac{\partial P}{\partial x}\right) \frac{a^2 b^2}{a^2 + b^2}$$

Q will be 4 u max twice a by 3 and that integral we have evaluated as 3 pi b by 16 ok. So, you can see. So, 4 it will become 4 this 2 it will become 2 this 3 3 will get cancelled. So, Q we will get as pi by 2 u max a b ok. So, now, if we put the value of u max, then we can write the volumetric flow rate as Q is equal to. So, u max is 1 by twice mu minus del p by del x a square b square by a square plus b square and another a b is there. So, Q will be pi by 4 mu minus del p by del x a cube b cube by a square plus b square ok.

So, you can see this term minus del p by del x is positive right so; obviously, Q is positive and now let us find what is the value of average velocity. So, for this elliptical duct we know the area of an ellipse is pi a b.

So, you can find the u average. So, Q is equal to A into u average and A is pi a b ok. So, you can see now u average you can find. So, this is the Q if you divide by pi a b. So, you can see

$\pi$  by  $4\mu$  if you divide by  $a$ . So, it will be  $1$  by  $\pi$   $a$   $b$  minus  $\frac{\partial p}{\partial x}$   $a^3 b^3$  by  $a^2 b^2$  plus  $b^2$  ok.

So, this  $\pi$  will get cancelled this  $a$   $b$ . So, it will become  $a^2 b^2$ . So, you can write average velocity  $u$  average as  $1$  by  $4\mu$  minus  $\frac{\partial p}{\partial x}$   $a^2 b^2$  by  $a^2 b^2$  plus  $b^2$ . Now let us consider two special cases. So, you can see for elliptical duct if you put  $a$  is equal to  $b$  is equal to  $R$  then; obviously, it becomes circular duct. So, we will consider that as a first case.

(Refer Slide Time: 28:15)

**Flow Through Elliptical Duct**

Special Cases:

# Circular duct  
 $a = b = R \rightarrow$  Hagen Poiseuille flow

$$u(x, y) = \frac{1}{2\mu} \left(-\frac{\partial p}{\partial x}\right) \frac{a^2 b^2}{a^2 + b^2} \left(1 - \frac{y^2}{a^2} - \frac{z^2}{b^2}\right)$$

$$= \frac{1}{2\mu} \left(-\frac{\partial p}{\partial x}\right) \frac{R^4}{2R^2} \left(1 - \frac{y^2 + z^2}{R^2}\right)$$

Setting  $r^2 = y^2 + z^2$   
 and switching to cylindrical coordinate

$$u(r) = \frac{1}{4\mu} \left(-\frac{\partial p}{\partial x}\right) R^2 \left(1 - \frac{r^2}{R^2}\right)$$

Volumetric flow rate;

$$Q = \frac{\pi}{4\mu} \left(-\frac{\partial p}{\partial x}\right) \frac{a^3 b^3}{a^2 + b^2}$$

$$Q = \frac{\pi}{4\mu} \left(-\frac{\partial p}{\partial x}\right) \frac{R^6}{2R^2}$$

$$Q = \frac{\pi}{8\mu} \left(-\frac{\partial p}{\partial x}\right) R^4$$

So, special cases. So, we will consider circular duct ok. So, if you put  $a$  is equal to  $b$  is equal to  $R$  then it will become just Hagen Poiseuille flow right Hagen Poiseuille flow ok. So, now, if you put  $a$  is equal to  $b$  is equal to  $R$  then we will get the Hagen Poiseuille flow. So, we have the expression of velocity  $u$   $z$   $y$  as  $1$  by twice  $\mu$  minus  $\frac{\partial p}{\partial x}$   $a^2 b^2$  by  $a^2 b^2$  plus  $b^2$

square plus b square 1 minus y square by a square minus z square by b square ok. So, now, let us put the value of a b as R.

So, you will get 1 by twice mu minus del p by del x. So, it will be R square R square. So, R to the power 4 here R square plus R square 2 R square and you will get 1 minus. So, in the denominator if you write R square. So, it will become y square plus z square.

So, now, if we switch to cylindrical coordinate and if you put small r square is equal to y square plus z square then we can see the Hagen Poiseuille flow this velocity profile. So, now, setting r square is equal to y square plus z square and switching to cylindrical coordinate. So, we can put here. So, you can see u will be function of r only.

So, it will become 1 by 4 mu minus del p by del x and you can see here R square and 1 minus r square by R square. So, you can see that this is the same expression what we derived for Hagen Poiseuille flow and now if you calculate the volumetric flow rate. So, we have Q is equal to pi by 4 mu minus del p by del x a cube b cube by a square plus b square. So, if you put a b as r then you can write Q is equal to pi by 4 mu minus del p by del x. So, it you can see you it will be R cube R cube. So, R to the power 6 divided by 2 R square

And final you can write Q as. So, pi by 8 mu minus del p by del x R to the power 4. So, it is the same expression what we derived for Hagen Poiseuille flow. So, now, let us derive the special case where you consider the plane Poiseuille flow ok. So, in case of plane Poiseuille flow we will consider b is equal to h and a is much much greater than h where 2 h is the distance between the 2 parallel plates.

(Refer Slide Time: 32:07)

**Flow Through Elliptical Duct**

Special Case:

# Flow between two infinite parallel plates  
 $a \gg H, b = H \rightarrow$  Plane Poiseuille flow

$$u(z, y) = \frac{1}{2\mu} \left( -\frac{\partial p}{\partial x} \right) \frac{a^2 b^2}{a^2 + b^2} \left( 1 - \frac{y^2}{a^2} - \frac{z^2}{b^2} \right)$$
$$= \frac{1}{2\mu} \left( -\frac{\partial p}{\partial x} \right) \frac{H^2}{1 + \frac{H^2}{a^2}} \left( 1 - \frac{z^2}{H^2} \right) \quad \frac{H}{a} \ll 1$$
$$u(y) = \frac{1}{2\mu} \left( -\frac{\partial p}{\partial x} \right) H^2 \left( 1 - \frac{z^2}{H^2} \right)$$

So, special case. So, this is the second special case where we are considering flow between two infinite parallel plates.

Here we will consider  $a$  is much much greater than  $H$  and  $b$  is equal to  $H$ . So, it will give plane Poiseuille flow ok. So, if we have the expression  $u$  which is function of  $z, y$  as  $\frac{1}{2\mu} \left( -\frac{\partial p}{\partial x} \right) \frac{a^2 b^2}{a^2 + b^2} \left( 1 - \frac{y^2}{a^2} - \frac{z^2}{b^2} \right)$  ok. So, you can see  $a$  is much much greater than  $H$ . So, ah; obviously, this term  $y^2$  by  $a^2$  will become very very small.

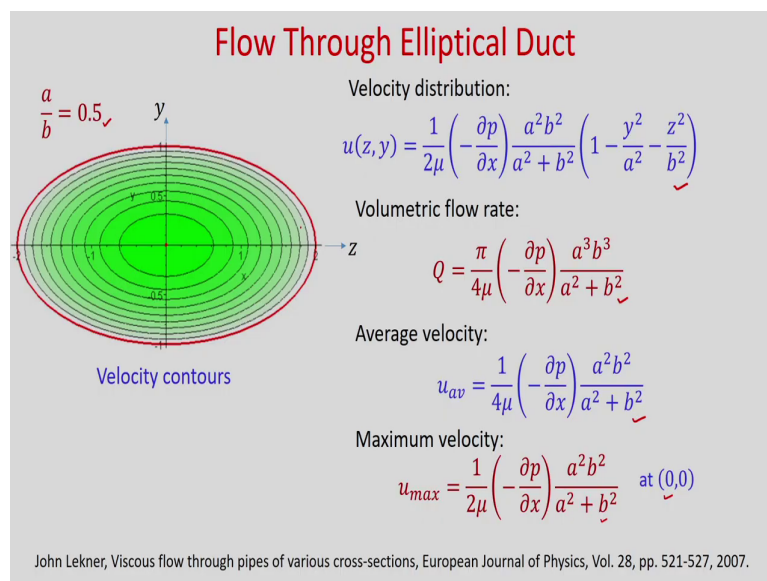

So, now,  $y^2$  by  $a^2$  will become very very small. So, if you put it then we will get  $\frac{1}{2\mu} \left( -\frac{\partial p}{\partial x} \right) \frac{b^2}{1 + \frac{b^2}{a^2}} \left( 1 - \frac{z^2}{b^2} \right)$ . So, if you put here  $b^2$  as  $H^2$  divided by  $1 + \frac{H^2}{a^2}$ . So, you divide by  $H^2$ . So, it will be  $1 + \frac{H^2}{a^2}$  means  $H^2$  by  $H^2$ .

So, you can see  $H$  by  $a$  is much much smaller than 1 much much smaller than 1 so, obviously, you can write this as  $H$  square and we have  $1$  minus  $ok$ .

So, we can have  $z$  square divided by  $H$  square because  $y$  square by  $a$  square will be very small. So, now, this will be very small. So, you can write  $1$  by  $2\mu$  minus  $\frac{\partial p}{\partial x}$  by  $\frac{a^2 b^2}{a^2 + b^2}$  into  $1 - \frac{z^2}{H^2}$   $ok$ . And now  $u$  is function of  $y$  only.

(Refer Slide Time: 34:33)

So, we have found the velocity profile for plane Poiseuille flow and it is same as we derived for the flow between two infinite parallel plates. So, now, let us summarize what we have done in today's class. So, we considered one elliptical duct with uniform cross section and we have found the equation for the wall first and; obviously, we assume the velocity profile such a way that it will satisfy the no slip condition at the wall.

So, from the we have written velocity profile as constant into the equation of the wall. So, from there we found the velocity profile and we found the constant a satisfying the governing equation. So, after that we found the volumetric flow rate and once we found the volumetric flow rate we could find the average velocity and we know the maximum velocity will occur at the central line and we have put  $y$  is equal to 0 and  $z$  is equal to 0 in the expression of velocity profile and we found the maximum velocity.

So, you can see that this is the velocity distribution whatever we have found and this is the volumetric flow rate and average velocity just we have divided by  $\pi a b$  which is your area. So, then we got the average velocity and setting  $y$  is equal to 0  $z$  is equal to 0 we found the maximum velocity. So, you can see here for the case  $a$  by  $b$  is equal to 0.5 we are showing the velocity contour.

So, in this case you can see that maximum velocity obviously, will occur at the centre line and these are the lines with constant velocity magnitude . So, you can see velocity contours follow the wall ok. So, it is the profile is similar like the wall of this duct.

Thank you.
