Momentum Integral Equation for Flat Plate Boundary Layer

Hello, everyone. So, in last class, we learnt the Blasius solution for flow over flat plate using similarity transformation. Today, we will use another method to solve the flow over flat plate. This method is known as integral method or approximate method. Why it is approximate method because depending on the assumed velocity profile will get the final solution.

There are many situations where it is very difficult to obtain the exact solution; in that case we can use this integral method.

(Refer Slide Time: 01:16)

Approximate Solutions: The Integral Method

Why approximate solution?

- When exact solution is not available or can not be easily obtained.
- When solutions are too complex, implicit or require numerical integration.

Advantages

- The integral method is simple and it can deal with complicating factors.
- The integral method is used extensively in fluid flow, heat transfer, mass transfer.

So, why do we need to use this approximate solution? When exact solution is not available or cannot be easily obtained; when solutions are too complex, implicit or require numerical integration. And, the advantages are the integral method is simple and it can deal with complicating factors. The integral method is used extensively in fluid flow heat transfer and mass transfer.

We will follow three procedures to use this integral method. First, we need to write down the governing equations, then you assume the velocity profile and express in terms of any unknown parameter; in this case, this unknown parameter is boundary layer thickness. And finally, you find this unknown parameter invoking the boundary conditions and you can write the velocity profile now using this known velocity boundary layer thickness.

(Refer Slide Time: 02:23)

Procedure

1. **Integral formulation of the basic laws**
The first step is the integral formulations of the principles of conservation of mass and momentum.
2. **Assumed velocity profile**
Approximate velocity profile is assumed which satisfy known boundary conditions.
A polynomial is usually used in Cartesian coordinate.
An assumed profile is expressed in terms of a single unknown parameter or variable which must be determined.
3. **Determination of the unknown parameter or variable**
Conservation of momentum gives the unknown variable in the assumed velocity.

So, these are the three steps we will follow to use this integral method. The first step is the integral formulation of the principles of conservation of mass and momentum. Next step is to assume the velocity profile. Approximate velocity profile is assumed which satisfy non-boundary conditions. Generally, a polynomial is used in Cartesian coordinate and an assumed profile is expressed in terms of single unknown parameter or variable which must be determined.

Finally, we will determine the unknown parameter or variable. So, conservation of momentum gives the unknown variable in the assumed velocity.

(Refer Slide Time: 03:07)

Accuracy

Since basic laws are satisfied in an average sense, integral solutions are inherently approximate.

Accuracy depends on assumed profile which is not unique.

The accuracy is not very sensitive to the form of an assumed profile.

There is no procedure available for identifying assumed profiles that will result in the most accurate solutions.

Since basic laws are satisfied in an average sense integral solutions are inherently approximate. Accuracy depends on assumed profile which is not unique. The accuracy is not very sensitive to the form of an assumed profile and there is no procedure available for identifying assumed profiles that will result in the most accurate solution.

Momentum Integral Equation For Flat Plate Boundary Layer

Boundary Layer Equations:

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$$

$$u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} = \nu \frac{\partial^2 u}{\partial y^2}$$

Integrating the above equation between 0 and δ

$$\int_0^{\delta} u \frac{\partial u}{\partial x} dy + \int_0^{\delta} v \frac{\partial u}{\partial y} dy = \nu \int_0^{\delta} \frac{\partial^2 u}{\partial y^2} dy$$

1st Term 2nd Term 3rd Term

3rd Term: $\nu \int_0^{\delta} \frac{\partial}{\partial y} \left(\frac{\partial u}{\partial y} \right) dy = \nu \left. \frac{\partial u}{\partial y} \right|_0^{\delta} = 0 - \nu \left. \frac{\partial u}{\partial y} \right|_{y=0} = -\frac{\tau_w}{\rho}$

Wall shear stress, $\tau_w = \mu \left. \frac{\partial u}{\partial y} \right|_{y=0}$

1st Term: $\int_0^{\delta} u \frac{\partial u}{\partial x} dy = \frac{1}{2} \int_0^{\delta} \frac{\partial u^2}{\partial x} dy$

So, let us consider flow over a flat plate. So, this is the flat plate of length L , x is the axial direction, y is the normal direction and this is the velocity profile u inside the boundary layer and U infinity is the free stream velocity. So, we can write down these boundary layer equations this is the continuity equation and this is the momentum equation, where ν is the kinematic viscosity.

So, we will use this equation first and we will integrate it between 0 and δ . So, δ is the boundary layer thickness and you know that this is function of x . So, we will write the terms as integral 0 to δ $u \frac{\partial u}{\partial x} dy$ plus integral 0 to δ $v \frac{\partial u}{\partial y} dy$ is equal to ν .

ν is constant; so, you can take it outside the integral. Integral 0 to δ $\frac{\partial}{\partial x} u^2 dy$. So, this is the 1st term, this is the 2nd term in the left hand side and this is the 3rd

term. So, now, we will evaluate this integral one by one. So, let us first consider the 3rd term. So, you can see the 3rd term is $\nu \int_0^\delta \frac{\partial^2 u}{\partial y^2} dy$. So, this term we can write as $\nu \left[\frac{\partial u}{\partial y} \right]_0^\delta$, ok. So, this now we can write as $\nu \frac{\partial u}{\partial y} \bigg|_0^\delta$.

So, $\frac{\partial u}{\partial y}$ at $y = \delta$ and limits 0 to δ . So, now, you can see that at $y = \delta$; that means, at the edge of the boundary layer obviously, the velocity gradient is 0, right. So, we will get 0 at $y = \delta$ and $-\nu \frac{\partial u}{\partial y} \bigg|_0$, ok. If we define the wall shear stress $\tau_w = \mu \frac{\partial u}{\partial y} \bigg|_0$, then you can see that this term $\frac{\partial u}{\partial y} \bigg|_0$ you can write τ_w / μ and here $\nu = \mu / \rho$.

So, finally, this 3rd term we can write as $-\tau_w / \rho$ ok. So, τ_w is the wall shear stress. Now, let us consider the 1st term. We have $\int_0^\delta u \frac{\partial u}{\partial x} dy$. So, this we can write it as $\frac{1}{2} \int_0^\delta \frac{\partial}{\partial x} (u^2) dy$. So, you can write $\frac{1}{2} \frac{\partial}{\partial x} \int_0^\delta u^2 dy$.

(Refer Slide Time: 07:32)

Momentum Integral Equation For Flat Plate Boundary Layer

2nd Term:

$$\int_0^{\delta} v \frac{\partial u}{\partial y} dy$$

Integrating by parts

$$= [vu]_0^{\delta} - \int_0^{\delta} \frac{\partial v}{\partial y} u dy$$

$$= U_{\infty} v_{\infty} + \int_0^{\delta} u \frac{\partial v}{\partial x} dy$$

$$= U_{\infty} v_{\infty} + \frac{1}{2} \int_0^{\delta} \frac{\partial (u^2)}{\partial x} dy$$

LHS = $\int_0^{\delta} \frac{1}{2} \frac{\partial u^2}{\partial x} dy + U_{\infty} v_{\infty} + \int_0^{\delta} \frac{1}{2} \frac{\partial u^2}{\partial x} dy$

$$= \int_0^{\delta} \frac{\partial u^2}{\partial x} dy + U_{\infty} v_{\infty}$$

$v_{\infty} = v_{\delta}$

Continuity equation,
 $\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$
 $\Rightarrow \frac{\partial v}{\partial y} = -\frac{\partial u}{\partial x}$

Now, let us consider the 2nd term. So, 2nd term, so, we have integral 0 to delta v del u by del y dy, ok. So, we can now use integration by parts. So, what we can write we can write v u and limits 0 to delta minus integral 0 to delta del v by del y u dy, ok. So, here you see v u limits 0 to delta. So, at y is equal to 0 obviously, velocities are 0. So, this will become 0 and at y is equal to delta. So, we need to write.

So, at y is equal to delta you can see that we have free stream velocity U infinity, but v is unknown. So, you will write U infinity v infinity; v infinity is to be determined minus. So, you can see del v by del y. So, now, let us consider the continuity equation. So, what is your continuity equation? Del u by del x plus del v by del y is equal to 0. So, you can write del v by del y is equal minus del u by del x. So, this term del v by del y, now we will write minus del u by del x.

So, this minus and here 1 minus is there. So, we will write plus integral 0 to delta $u \frac{\partial u}{\partial x} dy$, ok. So, this we can write $U \infty v \infty$ and this again we will write as half 0 to delta $\frac{\partial u}{\partial x}$. So, this u we are going to take inside this derivative. So, it will be $u^2 \frac{\partial u}{\partial x} dy$.

So, now, let us simplify the left hand side. We have two terms, we have already written those two terms. So, left hand side we are going to get the 1st term we have written 0 to delta half $\frac{\partial u^2}{\partial x} dy$ and this is the term $U \infty v \infty$ plus 0 to delta half $\frac{\partial u^2}{\partial x} dy$. So, you can see this is half $\frac{\partial u^2}{\partial x} dy$ and this is also half $\frac{\partial u^2}{\partial x} dy$.

So, these together will get integral 0 to delta $\frac{\partial u^2}{\partial x} dy$ plus $U \infty v \infty$. So, now, we need to find, what is $v \infty$; that means, v at y is equal to delta. So, for that, so, to evaluate this v at y is equal to delta again we will consider continuity equation.

(Refer Slide Time: 11:07)

Momentum Integral Equation For Flat Plate Boundary Layer

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$$

Integrating between 0 and δ

$$\int_0^\delta \frac{\partial u}{\partial x} dy + \int_0^\delta \frac{\partial v}{\partial y} dy = 0$$

$$\Rightarrow \int_0^\delta \frac{\partial u}{\partial x} dy + [v]_0^\delta = 0$$

$$\Rightarrow \int_0^\delta \frac{\partial u}{\partial x} dy + v_\delta - 0 = 0$$

$$\Rightarrow v_\delta = v_\infty = - \int_0^\delta \frac{\partial u}{\partial x} dy$$

$$\text{LHS} = \int_0^\delta \frac{\partial u^2}{\partial x} dy - \int_0^\delta \frac{\partial u}{\partial x} dy$$

So, we have the continuity equation $\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$. So, we will integrate this equation between 0 and δ within the boundary layer. So, obviously, we can write $\int_0^\delta \frac{\partial u}{\partial x} dy + \int_0^\delta \frac{\partial v}{\partial y} dy = 0$, ok.

So, this we can write $\int_0^\delta \frac{\partial u}{\partial x} dy$ and this you can see we can write v from 0 to δ is equal to 0. So, now, we can see we have 1st term as it is and this term you see at $y = 0$ ok; that means, on the flat plate $v = 0$, ok. So, we will get at $y = \delta$ is equal to v_δ ; that means, minus. So, at $y = 0$, this will be 0. So, is equal to 0.

So, v delta; that means, at y tends to infinity. So, v infinity we can write as minus integral 0 to delta $\frac{\partial u}{\partial x} dy$, ok. So, now, you can see that this v delta now we can substitute it here where this is your we have written v infinity which is your v delta.

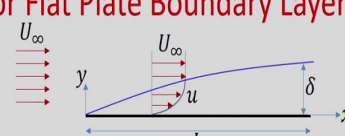

So; that means, v infinity; that means, at v is at y is equal to delta. So, this now we can substitute it then we can write left hand side as integral 0 to delta, $\frac{\partial u^2}{\partial x} dy$ plus now we have v delta.

So, v delta is having minus. So, we will write minus integral 0 to delta $\frac{\partial u}{\partial x} dy$. So, now we can see that we have this derivative inside the integral. So, to evaluate this integral we will use Leibniz rule of integration.

(Refer Slide Time: 13:30)

Momentum Integral Equation For Flat Plate Boundary Layer

The Leibniz integral rule gives a formula for differentiation of a definite integral whose limits are functions of the differential variables.

$$\frac{d}{dx} \int_{a(x)}^{b(x)} f(x,y) dy = \int_{a(x)}^{b(x)} \frac{\partial f(x,y)}{\partial x} dy + f(x,b(x)) \frac{db}{dx} - f(x,a(x)) \frac{da}{dx}$$

$a(x) = 0 \quad b(x) = \delta(x)$

$f(x,y) = u$

$$\frac{d}{dx} \int_0^{\delta} u dy = \int_0^{\delta} \frac{\partial u}{\partial x} dy + U_{\infty} \frac{d\delta}{dx} - 0$$

$$\int_0^{\delta} \frac{\partial u}{\partial x} dy = \frac{d}{dx} \int_0^{\delta} u dy - U_{\infty} \frac{d\delta}{dx}$$

$f(x,y) = u^2$

$$\frac{d}{dx} \int_0^{\delta} u^2 dy = \int_0^{\delta} \frac{\partial u^2}{\partial x} dy + U_{\infty}^2 \frac{d\delta}{dx} - 0$$

$$\therefore \int_0^{\delta} \frac{\partial u^2}{\partial x} dy = \frac{d}{dx} \int_0^{\delta} u^2 dy - U_{\infty}^2 \frac{d\delta}{dx}$$

So, you can see the Leibniz integral rules. The Leibniz integral rule gives a formula for differentiation of a definite integral whose limits are functions of the differential variable. So, you can see $d \int_a^b f(x) dx$, where a, b are function of x . So, these are the limits, function of x and $f(x, y)$ is equal to $\int_a^b f(x, y) dy$ plus f at the limits y is equal to b minus f at y is equal to a times da by dx .

So, here for this particular problem we have $a = 0$ because lower limit is equal to 0 and upper limit $b = \delta$ and δ is function of x . So, obviously, now if we choose the first function $f(x, y)$ is equal to u , then we can write from this Leibniz integral rule that $d \int_0^\delta u dy$ is equal to $\int_0^\delta \frac{du}{dx} dy$ plus u at $y = \delta$ minus u at $y = 0$ times $d\delta$ by dx .

Now, u at y is equal to δ ; that means, at y is equal to δ we have U . So, you can write plus U minus u at $y = 0$. So, $d\delta$ by dx and obviously, U at y is equal to 0; that means, this is no slip condition. So, u is equal to 0. So, this will become 0 minus 0 ok. So, we can write $\int_0^\delta \frac{du}{dx} dy$ is equal to $d \int_0^\delta u dy$ minus U times $d\delta$ by dx .

So, next the function we will consider $f(x, y)$ is equal to u^2 and we will use these Leibniz rule of integration. So, if $f(x, y)$ is equal to u^2 , similarly we can write $d \int_0^\delta u^2 dy$ is equal to $\int_0^\delta \frac{d(u^2)}{dx} dy$ plus u^2 at $y = \delta$ minus u^2 at $y = 0$ times $d\delta$ by dx . Now, here you can see that this is u^2 , but at y is equal to δ . So, it is U^2 .

So, it will be plus U^2 minus u^2 at $y = 0$ times $d\delta$ by dx ; obviously, at y is equal to 0 velocity is 0. So, it will be minus 0. So, we can write now $\int_0^\delta \frac{d(u^2)}{dx} dy$ is equal to $d \int_0^\delta u^2 dy$ minus U^2 times $d\delta$ by dx .

(Refer Slide Time: 17:02)

Momentum Integral Equation For Flat Plate Boundary Layer

$$\begin{aligned}
 \text{LHS} &= \int_0^{\delta} \frac{\partial u^2}{\partial x} dy - U_{\infty} \int_0^{\delta} \frac{\partial u}{\partial x} dy \\
 &= \frac{d}{dx} \int_0^{\delta} u^2 dy - U_{\infty}^2 \frac{d\delta}{dx} \\
 &\quad - U_{\infty} \left[\frac{d}{dx} \int_0^{\delta} u dy - U_{\infty} \frac{d\delta}{dx} \right] \\
 &= \frac{d}{dx} \int_0^{\delta} u^2 dy - U_{\infty}^2 \frac{d\delta}{dx} - U_{\infty} \frac{d}{dx} \int_0^{\delta} u dy + U_{\infty}^2 \frac{d\delta}{dx} \\
 &= \frac{d}{dx} \int_0^{\delta} (u^2 - u U_{\infty}) dy \\
 &= - \frac{d}{dx} \int_0^{\delta} u (U_{\infty} - u) dy
 \end{aligned}$$

$$\begin{aligned}
 \text{LHS} &= \text{RHS} \\
 - \frac{d}{dx} \int_0^{\delta} u (U_{\infty} - u) dy &= - \frac{\tau_w}{\rho} \\
 \text{Divide both sides by } U_{\infty}^2 & \\
 \frac{d}{dx} \int_0^{\delta} \frac{u}{U_{\infty}} \left(1 - \frac{u}{U_{\infty}}\right) dy &= \frac{\tau_w}{\rho U_{\infty}^2} - \text{Momentum Integral Equation}
 \end{aligned}$$

So, now let us simplify the left hand side and write the left hand side two terms as integral 0 to delta del u square by del x dy minus U infinity integral 0 to delta del u by del x dy. So, now, these we have evaluated using the Leibniz rule. So, now, let us put those values.

So, d by dx 0 to delta u square dy minus U infinity square d delta by dx and we have for this term minus U infinity d of dx integral 0 to delta u dy minus U infinity d delta by dx. So, now, we can simplify it. You can see we can write d of dx integral 0 to delta u square dy minus U infinity square d delta by dx.

Now, let us multiply this U infinity with these two terms. So, we will get minus U infinity d of dx integral 0 to delta u dy and this will be plus U infinity square d delta by dx ok. So, you

can see these term and this term will get cancelled. So, finally, we will get d of dx integral 0 to δ u square and here U infinity is constant, right.

So, you can take inside the integral. So, you can write minus u U infinity dy ok. So, you can write minus d of dx . So, we are we have to write this term first. So, integral 0 to δ we are taking u outside. So, it will be U infinity minus u dy . We have already evaluated the right hand side term which is the 3rd term in terms of the wall shear stress.

So, finally, these integrated this momentum equation we can write as. So, if we equate left hand side is equal to right and side; that means, right hand side we have this 3rd term. So, we can write as minus d of dx integral 0 to δ u U infinity minus u dy is equal to minus τ_w by ρ ok.

So, we can write this equation and divide both side by U infinity square and minus minus will get cancel. So, you can write d of dx integral 0 to δ u by U infinity 1 minus u by U infinity dy is equal to τ_w by ρ infinity square. So, this equation is known as momentum integral equation. So, now, we have written the integral form of the governing equation and we have derived the momentum integral equation, next step is to assume the velocity profile.

(Refer Slide Time: 21:01)

Momentum Integral Equation For Flat Plate Boundary Layer

Assume Velocity Profile:

$$u(x, y) = \sum_{n=0}^N c_n(x) y^n$$

3rd degree polynomial:

$$u(x, y) = c_0 + c_1 y + c_2 y^2 + c_3 y^3$$

Boundary Conditions:

- @ $y=0$, $u=0$
- @ $y=\delta$, $u=U_\infty$
- @ $y=\delta$, $\frac{\partial u}{\partial y} = 0$
- @ $y=0$, $\frac{\partial^2 u}{\partial y^2} = 0$

$\mu \frac{\partial^2 u}{\partial x^2} + \rho u \frac{\partial u}{\partial y} = \rho \nu \frac{\partial^2 u}{\partial y^2}$
 @ $y=0$, $\frac{\partial^2 u}{\partial y^2} = 0$

So, for laminar flow generally polynomial is used and if we write the polynomial of nth order, then you can see assume. So, you can assume the velocity profile as $u(x, y)$ as summation of n is equal to 0 to n $c_n(x) y^n$, where c_n is the coefficient and it is function of x . So, if we use 3rd degree polynomial so, for the velocity profile then $u(x, y)$ you can write as c_0 plus $c_1 y$ plus $c_2 y^2$ plus $c_3 y^3$.

Here we have 4 coefficients which are function of x and those are unknown. So, we need to find these unknowns and we need 4 boundary conditions because we have 4 unknowns. So, we need 4 boundary conditions, 3 boundary conditions are easy to write because you know that at y is equal to 0 we have no slip boundary condition. So, u is equal to 0.

At y is equal to δ ; that means, at the edge of the boundary layer we have the velocity profile u is equal to infinity and also the velocity gradient is 0; that means, $\frac{\partial u}{\partial y}$ at y

is equal to $\Delta u = 0$, but another boundary condition we need. So, that will derive the boundary condition from the governing equation invoking that at $y = 0$, velocity is 0.

So, let us write first the boundary conditions. So, at $y = 0$ $u = 0$; at $y = \Delta$ $u = U_{\infty}$; at $y = \Delta$ $\frac{\partial u}{\partial y} = 0$, velocity gradient is 0 ok. Now, we need to write another boundary condition. So, for that we will use the governing equation $u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} = \nu \frac{\partial^2 u}{\partial y^2}$.

So, this is derived boundary condition and we will put at $y = 0$; obviously, you can see that $u = 0$, at $y = 0$ $v = 0$. So, from here you can see the boundary condition will become $\frac{\partial^2 u}{\partial y^2} = 0$. So, we have another boundary condition at $y = 0$ $\frac{\partial^2 u}{\partial y^2} = 0$ and it is known as derived boundary condition. So, we have this polynomial now you invoke these boundary conditions.

(Refer Slide Time: 23:45)

Momentum Integral Equation For Flat Plate Boundary Layer

$$u = c_0 + c_1 y + c_2 y^2 + c_3 y^3$$

$$\frac{\partial u}{\partial y} = c_1 + 2c_2 y + 3c_3 y^2$$

$$\frac{\partial^2 u}{\partial y^2} = 2c_2 + 6c_3 y$$

@ $y=0, u=0 \Rightarrow c_0 = 0$

@ $y=0, \frac{\partial^2 u}{\partial y^2} = 0 \Rightarrow c_2 = 0$

$$u = c_1 y + c_3 y^3$$

@ $y = \delta, u = U_\infty \quad U_\infty = c_1 \delta + c_3 \delta^3$

@ $y = \delta, \frac{\partial u}{\partial y} = 0 \quad 0 = c_1 + 3c_3 \delta^2$
 $\Rightarrow c_1 = -3c_3 \delta^2$

$$U_\infty = -3c_3 \delta^3 + c_3 \delta^3$$

$$\Rightarrow c_3 = -\frac{1}{2} \frac{U_\infty}{\delta^3} \quad \therefore c_1 = -3c_3 \delta^2 = \frac{3}{2} \frac{U_\infty}{\delta}$$

So, we have u is equal to c_0 plus $c_1 y$ plus $c_2 y^2$ plus $c_3 y^3$, ok. So, you can write $\frac{\partial u}{\partial y}$ is equal to c_1 plus $2c_2 y$ plus $3c_3 y^2$ and $\frac{\partial^2 u}{\partial y^2}$ we can write as $2c_2$ plus $6c_3 y$. So, boundary conditions at y is equal to 0 u is equal to 0 ok.

So, if you put at y is equal to 0 u is equal to 0, that will give c_0 as 0; at y is equal to 0 we have $\frac{\partial^2 u}{\partial y^2}$ is equal to 0 ok. So, if you put here you will get c_2 is equal 0. So, these two coefficients are 0. So, we can write now u is equal to $c_1 y$ plus $c_3 y^3$.

So, now let us apply the next boundary condition at y is equal to δ u is equal to U_∞ . So, from here you can see that it will be U_∞ is equal to $c_1 \delta$ plus $c_3 \delta^3$ and we have at y is equal to δ $\frac{\partial u}{\partial y}$ is equal to 0. So, from here you can see that c_2 is

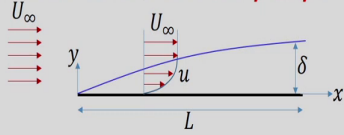

0. So, you will get left hand side del u by del y is equal to 0; in right hand side c 1, c 2 is 0. So, 3 c 3 delta square.

So, now, you solve these two equations and find c 1 and c 3. So, from here you can see that c 1 we can write as minus 3 c 3 delta square and from here you can see we have U infinity c 1 is minus 3 c 3 delta square and delta. So, it will be delta cube plus c 3 delta cube. So, from here you can see c 3 will be minus half U infinity by delta cube.

So, we will get c 1 as minus 3 c 3 delta square and this is minus c 3. So, it will be 3 by 2 you infinity by delta. So, we have found these 4 coefficients c naught and c 2 are 0 and we have nonzero values for c 1 and c 3. So, if you put these coefficients in terms of delta then we will get the velocity profile in terms of one unknown variable that is delta boundary layer thickness.

(Refer Slide Time: 26:45)

Momentum Integral Equation For Flat Plate Boundary Layer

$$u = \frac{3}{2} \frac{U_\infty}{\delta} y - \frac{1}{2} \frac{U_\infty}{\delta^3} y^3$$

$$\Rightarrow \frac{u}{U_\infty} = \frac{3}{2} \frac{y}{\delta} - \frac{1}{2} \left(\frac{y}{\delta}\right)^3$$

where $\delta = f(x)$

Momentum integral equation.

$$\frac{d}{dx} \int_0^\delta \frac{u}{U_\infty} \left(1 - \frac{u}{U_\infty}\right) dy = \frac{\tau_w}{\rho U_\infty^2}$$

$$\frac{u}{U_\infty} = \frac{3}{2} \eta - \frac{1}{2} \eta^3 \quad \eta = \frac{y}{\delta} \quad \begin{matrix} \text{at } y=0, \eta=0 \\ \text{at } y=\delta, \eta=1 \end{matrix} \quad \begin{matrix} y = \delta \eta \\ dy = \delta d\eta \end{matrix}$$

$$\frac{d}{dx} \int_0^1 \left(\frac{3}{2} \eta - \frac{1}{2} \eta^3\right) \left(1 - \frac{3}{2} \eta + \frac{1}{2} \eta^3\right) \delta d\eta = \frac{\tau_w}{\rho U_\infty^2} \quad \delta = \delta(x)$$

$$\frac{d}{dx} \left[\delta \int_0^1 \left(\frac{3}{2} \eta - \frac{1}{2} \eta^3 - \frac{9}{4} \eta^2 + \frac{3}{4} \eta^4 + \frac{3}{4} \eta^4 - \frac{1}{4} \eta^6\right) d\eta \right] = \frac{\tau_w}{\rho U_\infty^2}$$

$$\frac{d}{dx} \left[\delta \int_0^1 \left(\frac{3}{2} \eta - \frac{9}{4} \eta^2 - \frac{1}{2} \eta^3 + \frac{3}{2} \eta^4 - \frac{1}{4} \eta^6\right) d\eta \right] = \frac{\tau_w}{\rho U_\infty^2}$$

So, you can see we have u is equal to $\frac{3}{2} U_{\infty} \frac{y}{\delta} - \frac{1}{2} U_{\infty} \left(\frac{y}{\delta}\right)^3$. So, you can write u by U_{∞} as $\frac{3}{2} \frac{y}{\delta} - \frac{1}{2} \left(\frac{y}{\delta}\right)^3$ where δ is function of x ok. So, you can see that the velocity profile now we have expressed in terms of one unknown parameter that is δ . Now, we need to find the value of δ .

So, next we will put this assumed velocity profile which we have expressed in terms of one unknown parameters in the momentum integral equation and then we will find this unknown parameter δ . So, we have the momentum integral equation we have already derived $\int_0^{\delta} dx \int_0^u u (U_{\infty} - u) dy = \tau_w \frac{\delta}{\rho U_{\infty}^2}$.

And, we have this velocity profile and we can write this velocity profile u by U_{∞} in terms of η where we will define η as $\frac{y}{\delta}$ ok. So, if you put η is equal to $\frac{y}{\delta}$. So, you can write $\frac{3}{2} \eta - \frac{1}{2} \eta^3$ ok.

So, η is equal to $\frac{y}{\delta}$; that means, the limits now in terms of η you can see that at y is equal to 0; obviously, η is equal to 0 and at y is equal to δ η is equal to 1, and we have written y is equal to $\delta \eta$. So, you can write dy is equal to $\delta d\eta$ ok. So, now, all these you put in this expression.

So, we will get this momentum integral equation you can see $\int_0^{\delta} dx \int_0^1 \left(\frac{3}{2} \eta - \frac{1}{2} \eta^3\right) (1 - \frac{3}{2} \eta + \frac{1}{2} \eta^3) d\eta = \tau_w \frac{\delta}{\rho U_{\infty}^2}$. So, this term will be there $\frac{3}{2} \eta - \frac{1}{2} \eta^3$ and this will be $1 - \frac{3}{2} \eta + \frac{1}{2} \eta^3$. So, it will be $1 - \frac{3}{2} \eta + \frac{1}{2} \eta^3$ and dy is equal to $\delta d\eta$. So, it will be $\delta d\eta$ and this limit will be η is equal to 0 to 1, and right hand side we have τ_w by ρU_{∞}^2 .

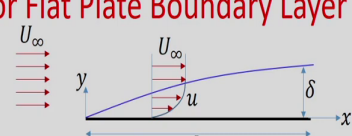

Now, let us find this integral and find the value of δ . So, you can see that if you multiply this then you will get $\int_0^{\delta} dx \delta$ you can see that you can take it outside right outside this integral because δ is function of x right δ is function of x . So, obviously, as you are integrating over this $d\eta$ so, you can take outside this integral this δ .

So, you can write delta integral 0 to 1, now you multiply this ok. So, if you multiply this you will get 3 by 2 eta minus half eta cube this if you use. So, it will be minus 9 by 4 eta square and this will be plus 3 by 4 eta to the power 4 and with these if you multiply it will be plus 3 by 4 eta to the power 4 and this will be minus 1 by 4 eta to the power 6 ok.

So, it will be d eta is equal to tau w by rho U infinity square. So, you can write d of dx delta integral 0 to 1. So, this term is 3 by 2 eta we have eta square minus 9 by 4 eta square, then eta cube only we have minus half eta cube eta to the power 4. So, these two terms together we can write 3 by 2 eta to the power 4 and we have minus 1 by 4 eta to the power 6 d eta is equal to tau w by rho U infinity square. So, now, you can integrate this ok.

Momentum Integral Equation For Flat Plate Boundary Layer

$$\frac{d}{dx} \left[\delta \left(\frac{3}{2} \frac{\eta^2}{2} - \frac{9}{4} \frac{\eta^3}{3} - \frac{1}{2} \frac{\eta^4}{4} + \frac{3}{2} \frac{\eta^5}{5} - \frac{1}{4} \frac{\eta^7}{7} \right) \right]_0^1 = \frac{\tau_w}{\rho U_\infty^2}$$

$$\frac{d}{dx} \left[\delta \left(\frac{3}{4} - \frac{3}{4} - \frac{1}{8} + \frac{3}{10} - \frac{1}{28} \right) \right] = \frac{\tau_w}{\rho U_\infty^2}$$

$$\frac{39}{280} \frac{d\delta}{dx} = \frac{\tau_w}{\rho U_\infty^2} \quad \leftarrow$$

$$\frac{u}{U_\infty} = \frac{3}{2} \eta - \frac{1}{2} \eta^3 \quad \frac{\partial u}{\partial \eta} = U_\infty \left[\frac{3}{2} - \frac{3}{2} \eta^2 \right]$$

$$\tau_w = \mu \frac{\partial u}{\partial y} \Big|_{y=0} = \mu \frac{1}{\delta} \frac{\partial u}{\partial \eta} \Big|_{\eta=0}$$

$$= \frac{\mu}{\delta} \frac{3}{2} U_\infty (1 - \eta^2) \Big|_{\eta=0}$$

$$= \frac{3}{2} \frac{\mu U_\infty}{\delta}$$

So, after integrating we can write d of dx delta. So, after integration 1st term will be 3 by 2 eta square by 2 minus 9 by 4 eta cube by 3 minus half eta to the power 4 by 4 plus 3 by 2 eta

to the power $5/5 - 1/4$ η to the power $7/7$ and limits 0 to 1 is equal to τ_w by ρU_∞^2 .

So, obviously, at η is equal to 0 if you put it will become 0. So, η is equal to 1, if you put then you will get $d/dx \delta$. So, it will be $3/4$. So, it will be $9/4$ and divided by 3. So, it will be $3/4$, it will be $1/8$, this will be $3/10$ and this will be $1/28$ is equal to τ_w by ρU_∞^2 .

So, now if you see it you will get this will be $39/280$. So, $39/280$ and it will be $d\delta/dx$ is equal to τ_w by ρU_∞^2 . So, we have already expressed the velocity profile in terms of the boundary layer thickness δ . So, from there we can find the τ_w in terms of δ .

So, τ_w is the wall shear stress. So, we have the velocity profile right as u by U_∞ is equal to $3/2 \eta - 1/2 \eta^3$, right. So, wall shear stress τ_w now we can write $\mu \frac{du}{dy}$ at y is equal to 0. So, in terms of η if you write; so, $\mu \frac{1}{\delta} \frac{du}{d\eta}$ at η is equal to 0.

So, now you can see if you put it $\frac{du}{d\eta}$, so, what you will get? $\frac{du}{d\eta}$ from here you can see it will be $U_\infty (3/2 - 3/2 \eta^2)$ ok. So, this we can write now μ by δ . So, it will become at η is equal to 0, right. So, $3/2 U_\infty$ at η is equal to 0.

So, and U_∞ will be there. So, from here you can see it will be $3/2 \mu U_\infty$ by δ . So, this you put it in this expression ok. So, we will get $39/280 d\delta/dx$ is equal to τ_w by ρU_∞^2 . So, τ_w is $3/2 \mu U_\infty$ by δ , ok.

Momentum Integral Equation For Flat Plate Boundary Layer

$$\frac{39}{280} \frac{d\delta}{dx} = \frac{1}{\rho U_\infty^2} \frac{3}{2} \frac{\mu U_\infty}{\delta}$$

$$\Rightarrow \delta d\delta = \frac{280}{39} \times \frac{3}{2} \frac{\mu}{U_\infty} dx$$

$$\Rightarrow \delta d\delta = \frac{140}{13} \frac{\mu}{U_\infty} dx$$

$$\Rightarrow \frac{\delta^2}{2} = \frac{140}{13} \frac{\mu}{U_\infty} x + C$$

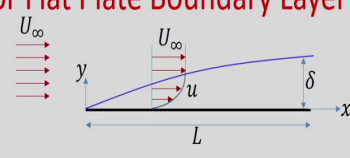

@ $x=0, \delta=0 \Rightarrow C=0$

$$\therefore \delta^2 = \frac{280}{13} \frac{\mu}{U_\infty} x$$

$$\Rightarrow \frac{\delta^2}{x^2} = \frac{280}{13} \frac{\mu}{U_\infty x}$$

$$\Rightarrow \frac{\delta}{x} = \sqrt{\frac{280}{13}} \sqrt{\frac{\mu}{\rho U_\infty x}}$$

$$\Rightarrow \frac{\delta}{x} = \frac{4.64}{\sqrt{Re_x}}$$

Reynolds number,
 $Re_x = \frac{U_\infty x}{\nu}$

So, now if you rearrange it, so, you will get delta you take in the left hand side. So, delta d delta and in the right hand side you take all other terms. So, it will be 280 by 39 into 3 by 2 and we have. So, mu by rho that we can write as nu and this U infinity, this U infinity square.

So, you will get nu by U infinity dx ok. So, 3 13 to 140. So, we can write as delta d delta is equal to 140 by 13 nu by U infinity dx. Now, if you integrate it we can write delta square by 2 is equal to 140 by 13 and nu and U infinity are constant, right. So, nu by infinity x plus constant c integration constant.

Now, we can find this integration constant by invoking that at the wall; that means, y is equal to 0. This integration constant c now we can find from at the leading edge at x equal to 0,

what is the boundary layer thickness? So, at x equal to 0 boundary layer thickness is 0, right. So, from there we can find the value of integration constant.

So, at x equal to 0 or x tends to 0, we have δ tends to 0 right. So, that means, if you put it here. So, that will give c is equal to 0. So, from here you can see you can write δ^2 is equal to $\frac{280}{13} \nu U_\infty x$.

So, from here you can see you can write as δ^2 by x^2 is equal to $\frac{280}{13} \nu$. So, x^2 we have divided. So, it will be $U_\infty x$. Now, you define the Reynolds number based on x ok. So, Re_x as $U_\infty x$ by ν then we can write δ by x as $\sqrt{\frac{280}{13} Re_x}$.

So, $U_\infty x$ by ν ; that means, 1 by Re_x ok. So, if you evaluate it you will get around δ by x is equal to $4.64 \sqrt{Re_x}$. So, you can see that we have already know the δ by x from the exact solution in last class we have derived. So, δ by x we have written is equal to $5 \sqrt{Re_x}$, but when we assumed 3rd degree polynomial of this velocity profile, then this is one approximate solution because we assume the velocity profile and we are getting close to this 5 right 4.64 and we have 5 in the numerator when we write δ by x .

So, it is very close. Now, let us find the other parameters like shear stress and skin friction coefficient.

(Refer Slide Time: 39:23)

Momentum Integral Equation For Flat Plate Boundary Layer

$$\tau_w = \frac{3}{2} \frac{\mu U_\infty}{\delta}$$

$$= \frac{3}{2} \frac{\mu U_\infty}{4.64 x} \sqrt{Re_x}$$

Friction coefficient,

$$C_f = \frac{\tau_w}{\frac{1}{2} \rho U_\infty^2} = \frac{3}{2} \frac{\mu U_\infty}{4.64 x} \sqrt{Re_x} \cdot \frac{1}{\frac{1}{2} \rho U_\infty^2}$$

$$C_f = \frac{3}{4.64} \frac{2}{U_\infty x} \sqrt{Re_x}$$

$$C_f = \frac{3}{4.64} \frac{1}{Re_x} \sqrt{Re_x}$$

$$C_f = \frac{0.646}{\sqrt{Re_x}}$$

So, if we know tau w already we have written 3 by 2 mu U infinity by delta ok. So, if you put the delta value here. So, you will get 3 by 2 mu U infinity and delta is 4.64 by root Re x right into x. So, now, let us write the skin friction coefficient which is non-dimensional representation of the shear stress. So, you can write friction coefficient C f is equal to tau w by half rho U infinity square. So, this if we put it here. So, we will get 3 by 2 mu U infinity by 4.64 x root Re x and we have 1 by half row U infinity square ok.

So, these 2, 2 will get cancel. So, we will get C f is equal to 3 by 4.64 and this rho and mu it will be nu and U infinity square 1 nu infinity in the numerator. So, you will get divided by U infinity x root Re x and nu by infinity x is equal to Re x right. So, it will be 1 by Re x and this is root Re x.

So, now you can write C_f is equal to 0.646 divided by root Re_x ok. So, if you remember from the exact solution we found this skin friction coefficient as 0.664 right divided by root Re_x . So, you can see that from integral solution δ by x we found 4.64 by root Re_x whereas, from the exact solution Blasius solution we got δ by x as 5 by root Re_x .

(Refer Slide Time: 41:39)

Momentum Integral Equation For Flat Plate Boundary Layer

<p>Integral solution</p> $\frac{\delta}{x} = \frac{\sqrt{280/13}}{\sqrt{Re_x}} = \frac{4.64}{\sqrt{Re_x}}$ $C_f = \frac{0.646}{\sqrt{Re_x}}$	<p>Blasius solution</p> $\frac{\delta}{x} = \frac{5}{\sqrt{Re_x}}$ $C_f = \frac{0.664}{\sqrt{Re_x}}$	
---	---	--

- Both solutions have same form
- Error in δ is 7.2% ✓
- Error in C_f is 2.7% ✓
- Accuracy of C_f is more important than δ

And, C_f we found today from the integral solution as 0.646 divided by root Re_x and in last class we found from the Blasius solution C_f as 0.664 by root Re_x . So, you can see that both solutions are having the same form, right. It varies as 1 by root Re_x and error in δ if you see that here you are getting 5 and here you are getting 4.64.

So, error in δ if you find then it will be 7.2 percent only and error in C_f you can see that it is very less compared to the boundary layer thickness. So, it is 2.7 percent. So, obviously, in

design point of view C_f is more important than δ and from here; obviously, you can also calculate the average friction coefficient C_{fL} .

So, in today's class we used integral method to solve the flow over flat plate. So, there are three steps first step is to write the integral form of the governing equation, next step is to assume the velocity profile and express in terms of one unknown parameter, boundary layer thickness δ and then find the δ and from δ you can get the velocity profile. And, hence you can find the boundary layer thickness and the skin friction coefficient.

So, first after integrating the governing equation we wrote the momentum integral equation and we use 3rd degree polynomial of the velocity profile and from there we found the four coefficients and then we expressed this velocity profile in terms of δ . And, invoking these velocity profile in the momentum integral equation we have found the unknown parameter δ .

And, from there we have found the skin friction coefficient and later we have found that based on what polynomial you are using you will get different solution in the boundary layer thickness δ by x and hence you will get different value of skin friction coefficient both average and local.

Thank you.
