Optical Communications**

**Week – V  
Module – III  
Modes in Optical fiber-I(contd.)**

by  
**Prof. Pradeep Kumar K**  
**Dept. of Electrical Engineering**  
**IIT Kanpur**

Hello and welcome to the course and optical communications in this module we will continue the discuss of the previous module we will apply the steps that we are outlined in the previous module to discuss and derive the optical modes inside an optical fiber okay we have spelled.

(Refer Slide Time: 00:30)

The image shows a handwritten derivation of the curl of the magnetic field  $\nabla \times \vec{H}$  in cylindrical coordinates. The derivation starts with the expression for the curl in cylindrical coordinates, where the  $\hat{z}$  component is circled in red. It then shows the expansion of the determinant for the curl, with the  $\hat{z}$  component of the curl being  $\hat{z} \left[ \frac{1}{r} \frac{\partial H_\phi}{\partial r} - \frac{1}{r} \frac{\partial H_r}{\partial \phi} \right]$ . This is equated to  $j\omega \vec{D}$ , where the  $\vec{D}$  term is crossed out. The permittivity  $\epsilon$  is defined as  $\epsilon = \begin{cases} \epsilon_0 \epsilon_1 & \text{core} \\ \epsilon_0 \epsilon_2 & \text{clad} \end{cases}$ . The permittivity in the core is  $\epsilon_r = n^2$  with  $n = n_1$ , and in the clad it is  $n = n_2$ . The electric field vector is expressed as  $\hat{r} E_r + \hat{\phi} E_\phi + \hat{z} E_z$ .

Out all the assumptions in the previous module so please go back and refer to those assumptions so the objective in the previous module at the end of the previous module was that we where

about calculate the electric field and magnetic field pattern and we would be starting with step one which corresponds to having starting and noting done the Maxwell's equations in the appropriate coordinate system because this is like an optical fiber which is cylindrical in nature it is easy for me to talk about the are easy for me to consider the cylindrical coordinates system cylindrical coordinate system is characterized by  $r_\phi$  and  $z$  coordinates.

And the unit vectors along  $r_\phi$  and  $z$  in terms of those the curl equation is given by this particular expression so you have to you do not have to remember this you can look at it from any text book are any hand book of mathematics the curl of  $H$  I have used  $H$  in this example but you can you know that  $E$  also needs a curl equation so in that case substitute  $H$  with  $E$  okay so curl of  $H$  as three components  $r_\phi$  and  $z$  components and for your bad luck none of these  $H_z$   $H_\phi$   $H_R$  components are 0.

So every exits so welcome to complications simple way of remembering this if you where to Keene if you are Keene on remembering this is to think of this as the determinant which is given by  $r^\wedge / r$   $\phi^\wedge$  and  $z^\wedge$  where  $r^\wedge$  is the unit vector along the radial direction  $\phi^\wedge$  is the unit vector along the Azimuthal direction and  $z^\wedge$  is the radial  $z^\wedge$  is a unit vector along the  $z$  axis that is axis of the cylinder so you have those  $r^\wedge$   $\phi^\wedge$  and  $z^\wedge$  and this the expression  $\gamma / \gamma_r$  stands for the partial derivative of with respect to  $r$   $\gamma / \gamma_\phi$  is the partial derivative with respect to  $\phi$  and  $\gamma / \gamma_z$  is the partial derivative with respect to  $z$ .

So this is the curl of  $H$  step 1 right down Maxwell's equations so I have written down curl of  $H$  having all these components but I know that curl of  $H$  on the right hand side is given  $J + \delta D / \delta t$  or because time derivative have been through out by converting into the phase form  $\delta / \delta t$  becomes  $J \omega \times D$  luckily for us  $J$  will be equal to 0 because there is no current inside an optical fiber because optical fiber is made out of dielectric region so the dielectric we are assuming it to be perfect dielectric no losses in the dielectric therefore this term will be equal to 0.

So lucky for us  $J$  is not there but you still have  $J \omega \times D$  there is one further simplification that you can make with this equation you can say that this is  $J \omega \times \epsilon E$  and the value of  $\epsilon$  will be different for the core and it would be different for the clad so this is for the core and this is for the clad where

$\epsilon_1$  and  $\epsilon_2$  are the relative permittivity's but I also know that relative permittivity is nothing but refractive index square so I can write down this  $\epsilon$  as  $\epsilon_0 n^2$  will substitute  $n = n_1$  for the core region  $n = n_2$  for the cladding region, okay.

So anyway we will not make this substitution at this point but I just said that you can do this one slightly later we will do that one slightly later so I have on the left hand side of this expression given this complicated looking expression but the right hand side is  $j\omega\epsilon E$  but if we have to you know expand this  $E$  itself  $E$  will be  $r E_r + \phi E_\phi + z E_z$  So you will actually have  $E_r$  component  $E_\phi$  component and  $E_z$  component, right.

Then you can equate the  $r$  component on the left hand side which is this expression to the  $r$  component on the right hand which is  $j\omega$  so if you multiply this whole thing by  $j\omega$ ,  $j\omega\epsilon$  then  $j\omega\epsilon E_r$  must be equal to this expression, okay. The one that I am showing here so this expression, similarly there will be a  $\phi$  expression or you know the component for the  $\phi$  that should be equal to  $j\omega\epsilon$  this should be equal to  $j\omega\epsilon E_\phi$ ,  $\phi$  of course, right. Because is the vector equivalence and this last one should be equal to  $j\omega\epsilon E_z$  okay again  $\epsilon$  should be different for coherent cladding that you have to keep in mind, okay.

(Refer Slide Time: 05:32)

Handwritten notes on a whiteboard:

- Permittivity tensor:  $\epsilon = \begin{cases} \epsilon_0 \epsilon_1 & \text{core} \\ \epsilon_0 \epsilon_2 & \text{clad} \end{cases}$
- Refractive index:  $\epsilon_r = n^2$
- Refractive indices:  $n = n_1$  Core,  $n = n_2$  Clad
- Electric field vector:  $\underline{E} = \hat{r} E_r + \hat{\phi} E_\phi + \hat{z} E_z$
- Curl equation:  $\nabla \times \underline{E} = -j\omega \underline{H}$  (Show)

So we have written down  $\nabla \times \mathbf{H}$  equal to this equation this is called as ampere Maxwell law then you also have Faradays Law which is  $\nabla \times \mathbf{E} = -j\omega\mu\mathbf{H}$  I leave this as an exercise to show, okay. So  $\nabla \times \mathbf{E}$  again will have this same you know three variables in place of  $\mathbf{H}$  you can simply replace  $\mathbf{E}$  and you will have to equate this one to the right hand side in the right hand side you will have  $-j\omega\mu\mathbf{H}$ , okay. So let me just write down it will take some time but I would like to just write down this one. So that you see all the equations at one side, okay.

(Refer Slide Time: 06:14)

$$\frac{1}{r} \left( \frac{\partial E_z}{\partial \phi} + j\beta E_\phi \right) = -j\omega\mu H_\phi$$

$$j\beta E_r + \frac{\partial E_z}{\partial r} = j\omega\mu H_\phi$$

$d\phi = j\omega E_r$

---

$$\frac{1}{r} \left( \frac{\partial}{\partial r} (r E_\phi) - \frac{\partial E_r}{\partial \phi} \right) = -j\omega\mu H_z$$

$$j\beta H_\phi = j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi}$$

$$j\beta E_r + \frac{\partial E_z}{\partial r} = j\omega\mu \left( j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi} \right)$$

$$= -\omega^2\mu\epsilon r E_r - j\omega\mu \frac{\partial H_z}{\partial r}$$

So let me just write down this equations, so equating the  $r$  components I get  $1/r \partial E_z / \partial \phi - \partial E_\phi / \partial z$  this should be equal to  $-j\omega\mu H_r$  now we introduce one more assumption, we will assume that no matter what the electric field or the magnetic field components are as a function of  $z$  they are given by  $e^{-j\beta z}$  they are characterized by a certain propagation constant  $e^{-j\beta z}$  therefore when you take  $\partial / \partial z$  here right.

On the  $z$  dependence what you are doing is you are simply pulling out this  $-j\beta$  just as for the phase  $e^{-j\omega t}$  you look deal by  $\partial / \partial t$  and pulled out  $j\omega$  here you are pulling out  $-j\beta$  so in that in the place of this  $-\partial E_\phi / \partial z$  I can write  $-j\beta$  times  $E_\phi$  so this part can be re-written so I can re-write this

equation I will write down here in the glue may be just to show the difference you get  $\partial E_z / \partial \phi + j\beta E_\phi$  this whole this is equal to  $-j\omega\mu H_r$ .

We do this simplification in other places as well, so the next equation that I get will be the  $\phi$  term which is  $j\beta E_r + \partial E_z / \partial r$  should be equal to  $j\omega\mu H_\phi$  okay and then you have the third equation which is the z component you get  $1/r \partial / \partial r r E_\phi - \partial E_r / \partial \phi$  this should be equal to  $-j\omega\mu H_z$  you are not lucky enough to replace  $\partial E_z / \partial r$  or  $\partial E_z / \partial \phi$ .

This should be equal to  $-j\omega\mu H_z$  you are not lucky in off to replace  $\delta z / \delta r$  or  $\delta z / \delta \phi$  well that is the life you do not get everything that you want so these are the curl equation for the electric field or the faradize law there must be equivalent or there must be analogs equations for  $\delta$  cross H as well which are any obtained from the top one right so what I will do is I will also leave this as an exercise to write down the corresponding terms to the H  $\delta$  cross H = j  $\delta d / \delta t$  I will start off with one expression you can fill in the remaining two so you will have  $1/r \delta H_z / \delta \phi + j\beta H_5$  right so replacing e/H this should be equal to  $j\omega$  epsilon  $E_r$ .

So you can fill in these two what you do in the next step is that you need to express  $E_r$ ,  $E_\phi$   $H_r$   $H_\phi$  in terms of  $E_z$  and  $H_z$  how do I do that well I have to try and you know equate couple of this equations right for example if I look at this one I know that  $E_r$  is given here so if I look at this equation to the left hand side I have  $j\beta E_r$  there is  $\delta E_z / \delta r$  right and then  $j\omega\mu H_5$  there is also one more equation here which is  $j\omega$  epsilon  $E_r$  equation which involves at  $j5$  term here and a  $H_z$  term here so if I can combine these two equations and substitute one in place of the other and simplify them then maybe I will be able to obtained a relationship for  $E_r$ .

Okay so I mean I can try doing this you can eliminate one with respect to the other so if I will just try it out now to see whether I can still do this analysis otherwise as usual I will leave this as an exercise to you it is not complicated you just have to look at one equation substitute for the other okay so let us, let us substitute for  $H_\phi$  from this equation right, so from this equation let us substitute for  $H_\phi$  let me re write that equations so I get  $j\beta H_\phi$  is =  $j\omega$  epsilon  $r E_r - \delta H_z / \delta \phi$  so I can substitute for  $H_\phi$  in this expression right so in this expression I can substitute so I get  $j\beta E_r + \delta E_z / \delta r = j\omega\mu$  for  $H_\phi$  I can substitute  $j\omega$  epsilon  $r E_r - \delta H_z / \delta \phi$  okay.

So if you expand this out you get  $-\omega^2\mu$  epsilon there is  $r E_r$  right and then you have  $-j\omega\mu \delta H_z / \delta \phi$ .

(Refer Slide Time: 11:28)

$$\frac{1}{r} \left( \frac{\partial}{\partial r} (r E_\phi) - \frac{\partial E_r}{\partial \phi} \right) = -j\omega\mu H_z$$

$$j\beta H_\phi = j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi}$$

$$j\beta E_r + \frac{\partial E_z}{\partial r} = j\omega\mu \left( j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi} \right)$$

$$= -\omega^2\mu\epsilon r E_r - j\omega\mu \frac{\partial H_z}{\partial \phi}$$

$$(j\beta + \omega^2\mu\epsilon r) E_r = -j\omega\mu \frac{\partial H_z}{\partial \phi} - \frac{\partial E_z}{\partial r}$$

$$E_r = - \frac{ \left( j\omega\mu \frac{\partial H_z}{\partial \phi} + \frac{\partial E_z}{\partial r} \right) }{ j\beta + \omega^2\mu\epsilon r }$$

I can pull this  $E_r$  on to the left hand side so I get  $j\beta + \omega^2\mu$  epsilon okay there is an  $r E_r$  here I hope that I have got the  $r E_r$  components correctly so I do get  $r$  this whole thing times  $E_r$  must be equal to  $-j\omega\mu \delta H_z / \delta \phi$  there is also  $-\delta E_z / \delta r$  okay so you get  $-\delta E_z / \delta r$  if I take  $-j$  as a common factor or no maybe I do not want to take them as a common factor at this point, but I can write down this  $E_r$  as  $-j\omega\mu \delta H_z / \delta \phi - \delta E_z / \delta r$  this whole thing so minus I can take out as a common factor so this becomes plus inside the brackets, so there is a  $-$  sign sitting out divided by  $j\beta + \omega^2\mu\epsilon r$ , they are seem to be a small problem here because I am not expecting this  $r$  here, so I was not really expecting this one in that case maybe where I have made a mistake is to write down the simplification somewhere.

(Refer Slide Time: 12:54)

$$\frac{1}{r} \left( \frac{\partial E_z}{\partial \phi} - \frac{\partial E_\phi}{\partial z} \right) = -j\omega\mu H_r$$

$$\frac{1}{r} \left( \frac{\partial E_z}{\partial \phi} + j\beta E_\phi \right) = -j\omega\mu H_r$$

$$j\beta E_r + \frac{\partial E_z}{\partial r} = j\omega\mu H_\phi \leftarrow$$

---

$$\frac{1}{r} \left( \frac{\partial}{\partial r} (r E_\phi) - \frac{\partial E_r}{\partial \phi} \right) = -j\omega\mu H_z$$

$$j\beta H_\phi = j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi}$$

$$j\beta E_r + \frac{\partial E_z}{\partial r} = j\omega\mu \left( j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi} \right)$$

So you can actually go back to this equation there was  $j\omega\epsilon$  times  $E_r$  here, and there was a  $1/r$  term sitting there and this was  $\delta H_z / \delta \phi + j\beta \delta H_\phi$ , so maybe when we substituted this equation we got  $j\beta H_\phi = j\omega\epsilon r E_r - \delta H_z / \delta \phi$ .

(Refer Slide Time: 13:18)

$$\begin{aligned}
 j\beta H_\phi &= j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi} \\
 j\beta E_r + \frac{\partial E_z}{\partial r} &= j\omega\mu \left( j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi} \right) \\
 &\quad - \omega^2 \mu \epsilon r E_r - j\omega\mu \frac{\partial H_z}{\partial \phi} \\
 (j\beta + \omega^2 \mu \epsilon r) E_r &= -j\omega\mu \frac{\partial H_z}{\partial \phi} - \frac{\partial E_z}{\partial r} \\
 E_r &= - \frac{\left( j\omega\mu \frac{\partial H_z}{\partial \phi} + \frac{\partial E_z}{\partial r} \right)}{j\beta + \omega^2 \mu \epsilon r} \\
 E_r &= \frac{-j}{q^2} \left( \beta \frac{\partial E_z}{\partial r} + \frac{\omega\mu}{r} \frac{\partial H_z}{\partial \phi} \right) \\
 q^2 &= \omega^2 \mu \epsilon - \beta^2 = k^2 - \beta^2 \quad \begin{array}{l} \text{core } k = k_1 = k_0 n_1 \\ \text{clad } k = k_2 = k_0 n_2 \end{array} \\
 &\quad \underline{k_1 > k_2}
 \end{aligned}$$

So we can look at that equation and then maybe you know you will forgive me for this one. What I would like to give you is the final expression so and I would like to give this an exercise to you, the result for  $E_r$  in terms of  $E_z$  and  $H_z$  is that you get  $-j/q^2$  there is  $\beta \delta E_z / \delta r + \omega \mu / r \delta H_z / \delta \phi$  where  $q^2$  is nothing but or  $q^2$  is given by  $\omega^2 \mu \epsilon - \beta^2$ , okay and we know that  $\omega^2 \epsilon$  defines the propagation constant  $k^2$  so this can be written as  $k^2 - \beta^2$  obviously in the core region  $k = k_1$  because this is nothing but the free space wavelength  $k_0$  times  $n_1$ , right whereas in the clad region  $k = k_2$  which is  $k_0$  times  $n_2$  and clearly  $k_1$  is larger than  $k_2$  because  $n_2$  is smaller than  $n_1$ , okay.

(Refer Slide Time: 14:34)

$$E_r = - \frac{j\omega\mu \frac{\partial H_z}{\partial \phi} + \frac{\partial E_z}{\partial r}}{j\beta + \omega^2\mu\epsilon}$$

$$E_r = - \frac{i}{q^2} \left( \beta \frac{\partial E_z}{\partial r} + \frac{\omega\mu}{r} \frac{\partial H_z}{\partial \phi} \right)$$

$$q^2 = \omega^2\mu\epsilon - \beta^2 = k^2 - \beta^2$$

core  $k = k_1 = k_0 n_1$   
 clad  $k = k_2 = k_0 n_2$

Oscillatory  $q^2 > 0$  Core  
 Exp(-) decaying  $q^2 < 0$  Clad

$k_1 > k_2$

So these are some results that you will know and if you look at the way  $q$  should behave  $q$  would actually be positive in the core region and  $q^2$  would be negative in the clad region, because of this there will be an oscillatory solution here and because of this nature there would be an exponentially decaying solution as we will see later, okay. So this is just for  $E_r$  where again I think I have made a mistake in multiplying the terms somewhere.

(Refer Slide Time: 15:08)

$$j\beta H_\phi = j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi}$$
$$j\beta E_r + \frac{\partial E_z}{\partial r} = j\omega\mu (j\omega\epsilon r E_r - \frac{\partial H_z}{\partial \phi})$$
$$= -\omega^2\mu\epsilon r E_r - j\omega\mu \frac{\partial H_z}{\partial \phi}$$
$$(j\beta + \omega^2\mu\epsilon r) E_r = -j\omega\mu \frac{\partial H_z}{\partial \phi} - \frac{\partial E_z}{\partial r}$$
$$E_r = -\frac{j\omega\mu \frac{\partial H_z}{\partial \phi} + \frac{\partial E_z}{\partial r}}{j\beta + \omega^2\mu\epsilon r}$$

EMAX

$$E_r = -\frac{j}{\gamma^2} \left( \beta \frac{\partial E_z}{\partial r} + \frac{\omega\mu}{r} \frac{\partial H_z}{\partial \phi} \right)$$
$$\gamma^2 = \omega^2\mu\epsilon - \beta^2 = k^2 - \beta^2 \quad k > k_c$$

Case  $k = k_1 = k_0 \pi a$   
Case  $k = k_2 = k_0 \pi b$

You can just figure it out where I have made a mistake that might be a very good exercise for you, so leave this as an exercise to show that  $E_r$  is given by this.

(Refer Slide Time: 15:18)

$$E_r = -\frac{j}{q^2} \left( \beta \frac{\partial E_z}{\partial r} + \frac{\omega \mu}{r} \frac{\partial H_z}{\partial \phi} \right)$$

$$q^2 = \omega^2 \mu \epsilon - \beta^2 = k^2 - \beta^2$$

core  $k = k_1 = k_0 n_1$   
 clad  $k = k_2 = k_0 n_2$

$k_1 > k_2$

Oscillating  $q^2 > 0$  core  
 ←  $< 0$  clad  
 Exp(-) decaying

$$E_\phi = -\frac{j}{q^2} \left( \frac{\beta}{r} \frac{\partial E_z}{\partial \phi} - \omega \mu \frac{\partial H_r}{\partial r} \right)$$

G. Keiser  
 p. 53  
 5<sup>th</sup> edn

$H_r =$   
 $H_\phi =$

Similarly, you can look up the text book and find out expressions for  $E_\phi$  in terms of these components so I will give you the answer you can sit and verify this, okay so this would be  $\beta/r \partial E_z / \partial \phi - \omega \mu \partial H_r / \partial r$  similarly there will be  $H_r$  and  $H_\phi$  I am not going to write them you can look at the text book write which is the text book that we are following for the course, and this is page number 53 of the fifth edition. So all these formulas are taken from there, so you can look at the text book when you have some time, okay this completes our step 2.

But what about step 3, well I need to know what is, the step 3 step 3 comes from solving hellhole equation that is.

(Refer Slide Time: 16:12)

$$k^2 E_z + \frac{(k^2 - \beta^2)}{q^2} E_z$$

$$\frac{\partial^2 E_z}{\partial r^2} + \frac{1}{r} \frac{\partial E_z}{\partial r} + \frac{1}{r^2} \frac{\partial^2 E_z}{\partial \phi^2} + q^2 E_z = 0 \quad ; \quad H_z \text{ (similar)}$$

$$\phi \text{ is periodic}$$

$$\phi = \phi_0 + 2n\pi$$

$$- \frac{e^{jv\phi}}{e^{-j\beta z}} \quad v = \text{integer}$$

$$\frac{\partial^2 E_z}{\partial r^2} + \frac{1}{r} \frac{\partial E_z}{\partial r} + \left( -\frac{v^2}{r^2} + q^2 \right) E_z = 0$$

$(\nabla^2 + k^2)E_z$  or  $H_z = 0$ , except that you now need to write down this  $\nabla^2$  in the cylindrical coordinate system, okay which again is a little bit of a problem so you will have to get to the expressions for the cylindrical coordinate system I will just give the solution here, okay. Since we are applying  $\nabla^2$  to  $E_z$  and in this particular case it is not  $k^2$  which is, which needs to be evaluated I mean included but rather  $q^2$  because that would correspond to  $\omega^2 \mu \epsilon - \beta^2$ , okay so because of that this would be  $q^2$ , okay.

In the case when you are assuming that  $E_z$  goes as  $e^{-j\beta z}$  okay, so alright let me just prove this one if you are little bit confused I can prove this one so let me write down what is  $\nabla^2$  applied to  $E_z$  in the cylindrical coordinate system so  $\nabla^2$  applied to  $E_z$  in the cylindrical coordinate system is another complicated expression but this is  $1/r \nabla^2 r E_z$  so this is actually  $r E_z / \nabla^2 r$  so this is the  $r$  expression  $+ 1/r^2 \nabla^2 E_z / \nabla^2 + \nabla^2 E_z / \nabla^2 z^2$ .

So this is the expression for  $\nabla^2$  now to this if you add  $k^2 E_z$  I can add  $k^2 E_z$  and I know that  $\nabla^2 / \nabla^2 z^2$  is nothing but  $-j\beta^2$  because  $\nabla / \nabla z$  pulls out  $-j\beta$  again you pull out  $-j\beta$  and  $-$  is  $+$  so  $j \times j$  is  $-$  so this is actually  $-\beta^2$  right so to this if you add  $k^2 E_z$  what you get is when you group the terms for  $K_z$

you are going to get  $k^2 - \beta^2 \times E_z$  that depends on  $r$  and five still remains the same so this plus this equation and this is the reason why I said  $k^2 - \beta^2$ .

Because that is defined as  $Q^2$  I can replace this in to this expression okay so if I do this and then write down what is the resulting expression also after taking this double differential thing you know after differentiating this one partially with respect to  $r$  twice and you know simplifying this equation you get  $\nabla^2 E_z / \nabla r^2 + 1/r \nabla E_z / \nabla r + 1/r^2 \nabla^2 E_z / \nabla \phi^2 + Q^2 E_z = 0$  and we will get a similar expression for  $H_z$  as well so similar for  $H_z$  component.

So this is the complicated equation that you are about to solve however the solution can be written in the form of well known functions if I recognize that  $\phi$  is actually a periodic function right my solution is should be periodic in  $\phi$  because if I change the azimuthally angle from say some value  $\phi_0$  to  $\phi_0 + 2n\pi$  where  $n$  is an integer I should basically get back to the same point right it is like going around the circle and I am back on to the same point when I change this an indolent by change the angle by  $2\pi$  radian thing.

So I am so my solution so also should be periodic they have to reflect this periodicity around the cylinder when you go in the azimuthally direction so that kind of a constrained allows us to choose the solutions as some  $e^{j\mu\phi}$  so let me chose this one as some  $\mu\phi$  okay where  $\mu$  is an integer okay  $\mu$  is an integer so my solutions is in terms of  $\phi$  will be along  $e^{j\mu\phi}$  okay, my solution in terms of  $z$  I know they are of the form  $e^{-j\beta z}$  the only thing which I do not know is what is the solution along  $r$ .

Substitute this kind of a solution in to this expression so when you take  $\nabla^2 / \nabla \phi^2$  this  $e^{j\mu\phi}$  will pull out  $j^2 \mu^2$  right which is nothing but  $-\mu^2$  so I can go back and rewrite the expression or the wave equations here I can say  $\nabla^2 E_z / \nabla r^2 + 1/r \nabla E_z / \nabla r - \mu^2 / r^2 + Q^2$  times  $E_z = 0$  so this is all  $E_z$  so this is + so you get a slightly simplified equation okay.

(Refer Slide Time: 21:11)

Handwritten derivation on a whiteboard:

$$\phi = \phi_0 + 2\pi i n z$$

$$\frac{\partial^2 E_z}{\partial r^2} + \frac{1}{r} \frac{\partial E_z}{\partial r} + \left( -\frac{\nu^2}{r^2} + q^2 \right) E_z = 0$$

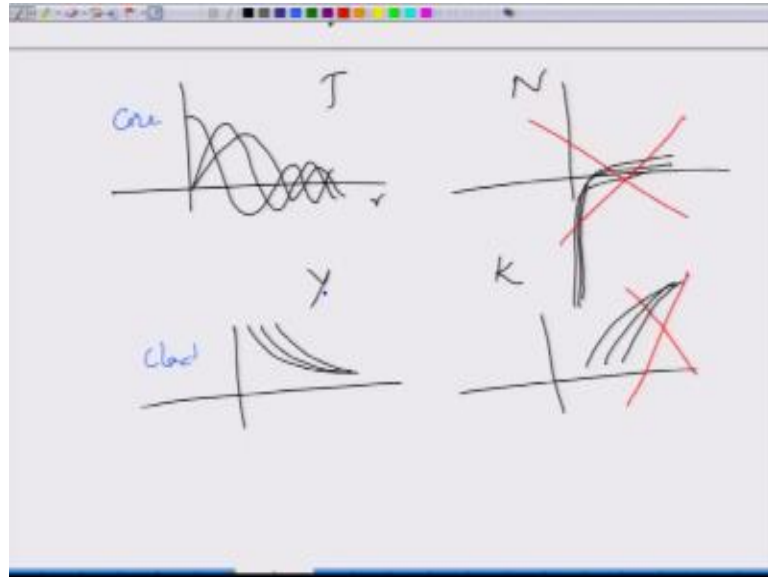

$$\frac{d^2 E_z}{dr^2} + \frac{1}{r} \frac{dE_z}{dr} + \left( q^2 - \frac{\nu^2}{r^2} \right) E_z = 0 \quad \leftarrow \text{Bessel eqn}$$

Annotations include:  $(uv)^2$  with arrows pointing to  $\nu^2$  and  $q^2$ ;  $e^{-j\beta z}$  with an arrow pointing to the  $z$  coordinate; and  $J_\nu$  with an arrow pointing to the  $\nu$  term in the Bessel equation.

And since this is only r function of r because for new constant value of new this entire term  $q^2 - \mu^2/r^2$  is just a function of r so I can remove this  $\nabla^2/\nabla$  kind of a thing and go to total divert so I get  $d^2 E_z / dr^2 + 1/r dE_z / dr + q^2 - \mu^2/r^2 \times E_z = 0$  it turns out that the solution of this equation this equation is known as Bessel equation Bessel differential equation the solutions of this r of two kinds this is the first kind and there are two types of first kind solutions which are given as  $J_\nu$  and let us say some this one that one you need so this  $\mu$  is the integer here  $J_\nu$  of some argument.

So if I call these argument as  $u^2$  inside the core and  $w^2$  in the cladding, so  $u^2$  is the core and  $w^2$  in the cladding the solution will be of the form  $J_\nu(ur)$  and then there will be one more solution which is  $N_\nu(ur)$ , okay, for the core solutions. And because in the cladding region this is defined as, rather I should define as the  $-w^2$ . Because I would like to define I am anticipating the result that the solutions have to decay, for the solutions to decay out inside the cladding this argument  $q^2 - \nu^2/r^2$  should be negative, okay, so that is given by negative  $w^2$ , okay, so because of that I get the solutions of the second kind. The second kind solutions are  $Y_\nu(wr)$ , and let say  $K_\nu(wr)$ , okay. And if you look at how these equations behave, you will see that.

(Refer Slide Time: 23:11)

If you sketch them as a function of the radial distance, this is how the solutions could behave. This is your  $J_0$  some arc, this is your  $J_1$  then you have  $J_2$ , okay these are like damped sinusoidal excitations, and then if you look at “n” that is the cell function of the first kind but with “n” you will see that these are all going towards infinity or rather minus infinity at  $R=0$ , then the other solutions, namely Y and K the solutions for Y will go as exponentially decaying solutions.

So these are the solutions and then for K you have exponentially increasing solution, okay, based on this nature it's obvious, that if I want some guiding inside I have to choose these as the core notes, and I have to choose these as the clad modes and reject these because at  $R=0$ , I don't want my field quantity to go to infinity, similarly my field quantity inside outside the cladding are not going to increase exponentially rather they would actually decay exponentially.

So because of that reason we will choose in the core region oscillator solutions, in the clad region exponentially decaying solutions, okay,

(Refer Slide Time: 24:25)

$w^2 = \beta^2 - k_0^2 n_2^2 > 0$   
 $k_0 n_1 > \beta$   
 $k_0 n_2 < \beta$

So my expression for  $E_z(r > a)$  that is to say, in the core will be given by some constant A similarly  $H_z(r > a)$  that is inside the core region, so this entire thing corresponds to core region will be another constant B in terms of their behavior inside the core there have to be special function of order  $v$ , first kind Bessel functions, order  $v$  and the argument for that inside will be  $v r$  and there will be  $e^{j v \varphi}$   $v$  is the integer  $e^{-j \beta z}$ , okay.

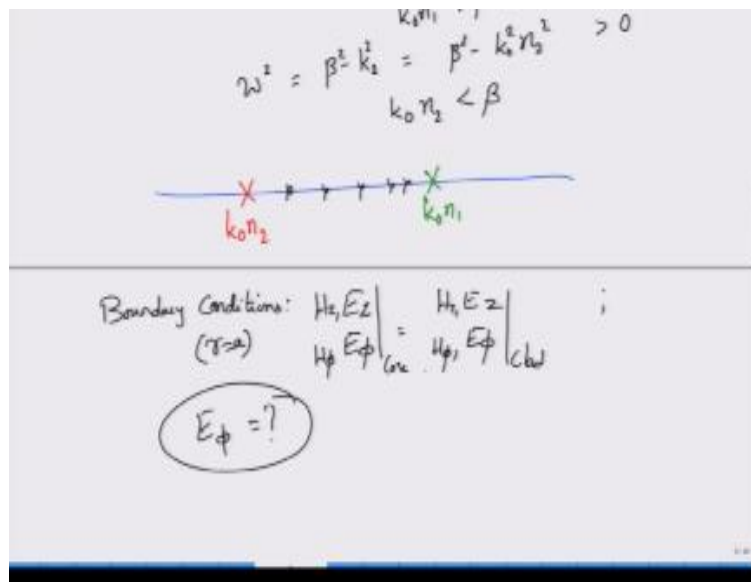

For the clad mode solutions the solutions must be  $E_z(r > a)$  and  $H_z(r > a)$  and this have to be some constants C and D, the constant C goes for  $E_z$  constant D goes for  $H_z$ , the argument here will be the same, it would be  $Y_v(wr)$  because these are the one which have to be decaying,  $e^{j v \varphi} e^{-j \beta z}$  so okay, so these are the constants AB and CD which you need to determine.

One very important thing before we entering this module is that the value of “u” which is, you know?  $k_1^2 - \beta^2$  that is given by  $k_0^2 n_1^2 - \beta^2$  has to be positive, which means that  $k_0 n_1 > \beta$ ,  $w^2 = \beta^2 - k_2^2$  or  $\beta^2 - k_0^2 n_2^2$  has to be positive or rather the  $k_2^2 - \beta^2$  has to be negative or  $w^2$  has to be positive, that is the solution. So for this reason  $k_0 n_2$  should be less than  $\beta$ , so you will see that actually end up with the range of  $\beta$ , on the lower side you have  $k_0 n_2$  on the upper side you have  $k_0 n_1$  and the value of  $\beta$  will be any discrete value that would be lying between  $k_0 n_2$  and  $k_0 n_1$ .

You can actually substitute apply boundary condition, I will not talk about the boundary condition here, the boundary conditions are for the tangential components at the boundary interface  $r=a$  that is  $E_z$  and  $E_\phi$ , please remember  $E_r$  is not the tangential component at  $r=a$ , similarly you Have the tangential component  $H_z$  and  $H_\phi$  for the magnetic fields and all your saying is that these values in the core must be equal to these value, that is to say, the values  $E_z$  in the core and  $E_\phi$  in the core must be equal to  $E_z$  and  $E_\phi$  in the clad. I already have  $E_z$ , but then it is your job to find out  $E_\phi$ .

(Refer Slide Time: 27:44)

What is  $E_\phi$  find out that, similarly there will be equivalent results for  $H_z$  and  $H_\phi$  as well, the core  $H_z$  and  $H_\phi$  must be equal to clad  $H_z$  and  $H_\phi$  at the boundary. So you can apply the boundary conditions and to end up with the complicated equation for finding  $\beta$ , that equation is called as the characteristic equation which gives you the roots of  $\beta$  or also if you solve the characteristic equation, you are going to find the values of  $\beta$ . In the next module we will take up more properties. Thank you very much.
